

NEW PROBLEMS IN MENSURATION.

NEW PROCESS.—Prof. Mason recently addressed the New York Bullion Club on the eubject of assaying. In the course of his lecture he explained a new process for parting gold and silver, whicb he had introduced into the assay office, and whicb had eaved the Government about $100,000 a year. In this procese sulphnric acid was used instead of nitric acid, and the silver was precipitated by the introduction of a piece of copper into the matrice. He illuetrated by actual experiment. He eaid that in the old process the chemicals were wasted, but by the new method the cost of material was nearly all saved. The gold and silver after heing assayed were pressed into cheeses, worth about $20,000 and $9,000 respectively. He said about $5,000,000 worth of gold was used annually in tbe arts.

Santa Fe's Sensation.

The Cerrillos mines, now attracting so much attention, are located in a low, isolated range of mountains about 20 miles southwesterly from Santa Fe and between 12 and 14 miles east of the Rio Grande. The Cerillos cover quite an extsnsive area of ground, the Galisteo creck ruuning along its extreme southwesterly border. The formation is granits with an occasional cropping out of sand and limestone. The minerals found are silver, copper, lead, iron and coal. Gold has not, as yet, in the Cerrillos, been found in any considerabls quantities, although extensive placer, as well as lods mines of this mineral are successfully worked a little to the south and east. Mining in the Cerrillos has been almost entirely for silver, and so far as any information of the working of the mines in ages past can be obtained, with large results.

It is well known, historically, that aftsr the conquest of New Mexico by the Spaniards, the principal business carried on by the conquerors was that of mining, and tradition tells us that their receipts in tbat line were enormous. Even the Indians were reduced to servitnde and compelled to do the mining. This they endured till ths year 1680, when a general uprising took place, and the Spaniards were driven from the country. On their return, eome years later, the Indians refused to submit to their rule except upon the conditions that the mines should not be reopened, and that they sbould never again be deprived of their personal freedom. These conditions were accepted and kept in good faith, and the consequence was that the mines remained nntouched during the wbole of the eubsequent Spanish rule. Many of tbese old mines are yet to be seen in this Territory, proof efficient, we think, not the least important of wbich are tbe present Cerrillos mines. Unfortunately for tbe obtaining of any statistical information of the working of these mines, every record that could be found at the time of the uprising was destroyed by tbe Indians, and some 20 years having elapsed before the Spaniards were enabled to again fully eetablish themselves, there is therefore no actual statistical knowledge of the workings of any single mine in the Territory, althougb it is a well-established fact that the owners in the aggregate amassed from them immensely large fortunes.

Some of these old mines at tbe Cerrillos seem not to have been touched after abandonment; others, as if for protection, were covered up, while others that are in the Territory are so carefully concealed that it requires close scrutiny to discover any traces of them.—*Santa Fe Sentinel.*

THE London *Times* says that the recent epeculation iu silver has partially if not wholly ceased.

Leadville's Gold.

No little has recently been said in the papers about tbe discovery of gold near Leadvills. The locality of "the find" was not first given, but it has now come to light that Granite, 18 miles from Leadville, in Chaffee county, is the location. This is an old gold-mining camp, and it was in one of ths old shafts that ths gold wes found. According to the Leadville papers, the mountain over which the excitement is now raging was worked for gold as far back as 1867, and $750,000 of the precious metal was teken from various shafts and tunnels, having since besn abandoned as worked out. About two weeks since a party of old gold-miners, went to Granite, and found thers an abandoned tunnel 130 feet long, tbe timbsrs end track of which wsre in an excellent state of preservation. The idea struck them of makiug an examination, and they worked but a short time when they came into the vein, dipping down the hill from where work had been stopped by the former owners, the crevice which they had been working merely pinching out at this point. Of course they were slated over this discovery, and at once started out for Leadville to have assays made and determine whether or not the tunnel had an owner. Diligent search was made, both at Granits and Fairplay, but no record was found of the property, and even if thers had been the lapse of time since eny work had been done on the property would leave it subject to relocation. This was done at oncs, and the tunnel christened the Mamis.

The *Reveille* says ths vein matter consists of one-third clay, one-third yellowish quartz, and one-third quartz largely stained with iron. The occasional fres gold is contained in the clay uext to the walls. Mr. Morse, of ths Bank of Lsadville, in person took a sack of samples of tbe averags vein matter, gave it to Prof. Fluegger of the St. Louis company, who crushed and assayed it, after which Messrs. Petrick & Bridge, Prof. Hayes, Tbercks & Co. make asseys from the sams sack. All these assays ran from 145 to 168 ounces in gold. These are facts. There is no doubt at present that there is a very extensive and paying gold region betwcen Granite and Leadville. The main reason why thess diggiugs wsre abandoned is, that they were exclusively worked for fres gold which only occurs in occasional pockets.

The same papsr makes the following commsnts: "Meu of capital, or a few strong companies who will take hold of these various claims, can make them highly remunerative by providing all of the appliances necessary to work to the best advantage, and treet their own ores by the most improved machinery for saving gold. But for the poor man, excepting the advsnturous prospector, the district is not enticing, for the very sufficient reason that mining in hard quartz is slow and expensive work, celculated to toucb the bottom of his purse before he cau open a mins to pay. This impression may be srroneous, but it is nevertheless offered for the sole purpose of warning men of small msens not to rush off to what eppears to promise a certain disappointment, founded upon the reasons just given. As there are no custom mills near the mines, ores must he hauled either to Leadville or Denver, or erected upon ths ground, and hence poor meu cannot work to the same advantage as rich. Still there is an area of two miles square in which ars strong leeds outcropping, whicb may prove rich to ths prospector willing to sell a promising discovery. Ou the other hand, so fer as our observation extended, no recent rich strikes have been made, the old claims furnishing all the free gold quertz that has been forwarded to this city for assay."—*Denver Tribune.*

The Mimbres Valley.

The Mimbres valley, from the old crossing at the town of Lower Mimbres up to San Lorenzo, is settling up rapidly. In traveling along the river one never loses sigbt of housee, and eech settler has his few acres, or larger tracts of ground, under cultivation. Much new lend has been broken this year, new buildings are in course of erection, and upon every hand may be seen the evidences of thrift and prosperity. The valley is well timbered, and is capable of sustaining a much larger population than it at present contains. At some points the width of hottom land capable of irrigation is fully equal to that of the Rio Grande.

It is estimated that nearly 3,000 acree are now under cultivation along the valley, the greater part of which is in wheat and corn. The yield is remarkable, being upwards of 30 bushels to the acre of the former cereal, and 60 bushele to the acre of the latter. Should no unforeseen accident occur, it is thought that the aggregate product of the present year will reech 15,000 fanegas of wheat, and 20,000 fanegas of corn. The valley, between the points named, is about 27 miles in length, and although the river has quite a heavy fall throughout the entire distance, the rise is so gradual as not to be perceived by a casual observer. The scenery is varied in its character and extremely beautiful; affording here and there a distant view of towering mountains, with broad stretcbes of grass-covered plain reaching down to the very river hank, and again, a picture of the shady groves and bread green acres of the valley proper, framed upon either side by abrupt foothills bearing the russet coat of a bygone season. The water of the river is clear as cryetal.—*Grant Co. (New Mexico) Herald.*

The Engineer.

Locomotive Performances.

The master mechanic of the Pittsburgh, Cincinnati & St. Louis road gives the following handsome showing, in regard to the performance of engine No. 207, built at the company's shops, and placed in service December 10th, 1874:

Up to March 3d, 1878, the engine had run 1,178 consecutive days, making an average of 122 3-10 miles per day, or a total of 144,226 miles.

	Cents.
Cost per mile for repairs	1.53
Cost per mile for fuel	4 69
Cost per mile for stores	0.67
Cost per mile for engineer and fireman	4 14
Total average cost per mile	11.24
Average number of cars drawn per mile	5.11

This was accomplished without any repairs except the current repairs attending each trip, but a change in the gauge of track made it necessary to change the gauge of the wheels, and she was taken into the shop for that purpose after making the above record. The machinery was found in good condition and entirely capable of making another 50,000 miles.

A single locomotive on the Kansas Pacific recently hauled a train of 58 empty and 15 loaded cars, with caboose attached, from Ellis to Brookville, a distance of 102 miles, in 9 hours and 30 minutes. The monster locomotive "Uncle Dick," described in a late number of this paper, has already achieved distinction by climbing the steepest grade of the mountain division of the Atchison, Topeka and Santa Fe railroad, drawing 22 loaded cars.

Real Material Triumphs.

The conquests of engineering skill over natural obstacles are actual, substantial triumphs, from which there never can be any discount.

Architecture, music, painting—all that adorn civilization—are of course well in themselves. But neither of these, or the terrible glory which ensanguines the path of the military hero, can compare in usefulness and permanence with the achievements of modern engineering.

Even a savage like Chief Joseph could comprehend this fact, and when he was asked if the capitol at Washington did not astonish him, he replied "no,"—he was "not surprised at all, for anyone could put up a big pile of stones with a woman on top." But what did fill him with unutterable amazement was to see the false-hearted white man throw a cobweb of iron over the big waters, and drive his steam wagon over it. The first of these structures that he crossed, he wrapped his head in his blanket, expecting that his last hour had come.

Even to those accustomed to such feats, the achievements of the past 30 years in railroad progress and engineering skill must seem like a brilliant, bewildering drama.—*Railway Age.*

The Importance of Straight Lines on Railroads.—The importance of securing straight lines for railroad tracks is fully shown by the expense which the Pennsylvania Railroad Company is willing to incur in straightening a short section of that road, as will be seen by the following item: On April 25th the Pennsylvania Railroad Company awarded contracts for the graduation of a straight new track, a little more than five miles in length, extending from Glenloch to Woodbine, which is intended to supersede the existing line between those points. The proposed improvement will form part of the important work, gradually progressing for some years, of straightening the eastern portion of the Philadelphia division. When completed it will avoid or save more than 300° of curvature, but will reduce the distance traversed only about one-sixth of a mile. When finished it will render useful service by enabling freight locomotives and trains to avoid the difficulties and increased expenditures that grow out of the numerous existing curves. In this connection we may remark that the Central Pacific railroad is now negotiating for the purchase of land in Oakland at a cost of many thousands of dollars to straighten a portion of their track, less than half a mile in length.

A Railroad from Europe to Central Asia and India.—The Grand Duke Nicholas of Russia has issued a pamphlet urging the speedy construction of an Orenburg-Tashkend railway. His argument for this route, based on that of De Lesseps and Cotard, is, in brief, as follows: If a grand circle be drawn of the globe between London and Calcutta, the segment of it intersected between the two cities goes through Amsterdam, then a little south of Berlin, then through Warsow, through southern Russia to the Caspian sea, which it cuts somewhat above 44° of latitude; then through the sea of Aral, proceeds to the east Samarkand, cuts the Indus about a hundred miles south of its great angle, and goes down the valley of the Ganges to Calcutta. Russia is in possession of the Asiatic part of that shortest route to India. She ought consequently to construct at once the line of railway which most closely follows it—to wit, from Orenburg to Tashkend.

Vanderbilt's Tunnel.—The work in the tunnel under the Detroit river at Gross Isle was begun April 22d, on the Canada side.

Useful Information.

To Remove Grease and Paint Spots.—The *Manufacturer and Builder* gives the following useful hints under the above head: The treatment varies according to the material; white linen can stand alkaline lyes, while cotton, especially when colored, does not stand it so well, and wool or silk not at all. To take grease spots out of linen, cotton or wool, first try soapsuds; if these do not take them out perfectly, you may use a potash or soda lye for linens; for wool it is best to use ammonia, or strong soapsuds mixed with ammonia. If the grease spots are produced by the drippings of a stearine candle, which often happens, use strong alcohol; this is also good for silk; but ordinary grease cannot be taken out with alcohol; it is necessary to use ether or benzine, and in any case to rub carefully with a clean rag, so as to remove the dissolved grease. Do not (as we have often noticed some persons do) merely pour some benzine on the grease spot and let it dry up; if you do not rub it out the whole operation is of no use. Silk requires great care, as also does paper, and it requires some experience to become an expert. One method, especially adapted for removing grease spots from light-colored silks and valuable papers, is to cover the spot with pulverized magnesia, chalk, fuller's earth, or pipe clay; lay a paper over it and then press with a hot iron; the heat will liquefy the grease and the powder will very readily absorb it. The yolk of an egg and ox bile are also recommended for silk, and soap also when used with care. In regard to varnishes, they are usually soluble either in turpentine or strong alcohol of 95°, and more easily removed than some oil paints. The most obstinate of the latter is zinc white, which, in combination with linseed oil, forms a hard white crust, which, as it resists most the above-mentioned solvents, is very difficult to dissolve out when it has penetrated into the texture, and especially when the material is woolen cloth.

Covering for Boilers, Steam Pipes, Etc.—A French firm is using a composition for covering boilers, steam pipes, and similar articles, which is certainly cheap and said to be very effectual. The surfaces are covered with sawdust mixed with flour paste. If the paste is not very liquid, the mixture being used in the form of moderately stiff dough, and the surfaces of the boilers or pipes have been well cleaned from grease, the adhesion is perfect and the material is free from cracks. Five layers of this composition are recommended, each about one-fifth of an inch thick. It is said that one inch of this composition will give better results than double that amount of the materials usually employed. The paste is composed of rough flour without the addition of starch. The mixture can be applied with a trowel, and, if there is much exposure, two or three coatings of tar will render the composition impervious to water. Copper tubes should first be treated to a hot liquid solution of clay, so as to increase the adhesion of the sawdust.

Flint Bricks.—Under the title of "Improvements in furnaces and other building blocks, retorts, crucibles, and other fire-resisting articles" a patent has recently been taken by Mr. D. Selwey, of Brigend, Glamorganshire, for bricks composed of pure flint, without the admixture of alumina or any other substance to detract from the high refractory character of the material. The inventor treats the flints in such a manner as to produce from them, when in a pulverized condition, bricks or blocks of great structural strength and durability, superior in fire-resisting properties, it is said, to the best descriptions of fire-clay goods. His patent also extends to the manufacture of artificial stone for building purposes. The material when burned resembles a fine-grained freestone, and is sufficiently hard to resist the action of the weather. It is in furnace work and similar applications, however, that these bricks are expected to be most successful.

Testing Oil by Electricity.—Among the many uses to which electricity is now put, may be mentioned the testing of oils. Prof. Palmieri, of Naples, well known for his observations in connection with the eruptions of Mount Vesuvius, has discovered that the resistance which oils offer to the passage of electricity, is in proportion to their purity. The professor has constructed an apparatus which shows, by comparison with pure olive oil as a standard, to what extent oil is adulterated, for the former is the worst conductor of electricity, while adulterated oils have a greater conductivity. The apparatus also indicates other mixtures, as, for instance, an even insignificant addition of cotton in a silk tissue.

Oil Paint.—A writer to the *English Mechanic* says: The cheapest and best solution I know of I accidentally discovered, and it may be worth while to tell how, though very likely some may know of it. In trying experiments for press-copying some old letters, amongst others I used successfully a solution of one tablespoonful of vinegar and one ounce of washing soda to a half pint of water. A little of this was spilt on the painted window-sill and in wiping it up the paint came entirely off, leaving the bare board quite clean. Try it; a gallon will not cost 50 cents.

To Blacken Zinc.—A process for chemically blackening zinc has been devised by M. Fuscher, an outline of which is published in the last number of the transactions of the Frankfort "Physisches Verein." The inventor first scours the zinc to be operated on with fine sand and very dilute hydrochloric acid, and then plunges it into a solution of equal parts of chlorate of potash and sulphate of copper in 36 parts of water. When withdrawn, after a short interval, it is found to have taken up a fine coating of velvety black, which, however, at this state very readily comes off. To insure its permanency, the zinc thus coated is quickly washed with water, allowed to dry, and then plunged into a weak solution of asphalt in benzole. The excess of this fluid is allowed to drain off, and the color can then be fixed by rubbing the sheet with a cotton plug. Zinc thus blackened is found to be particularly suitable for covering in roofing.

For Utilizing Old and Waste Rubber.—Messrs. Danckwerth and Kohler have recently patented the following procedure in Germany: The rubber waste is subjected to dry distillation in an iron vessel over a free fire, with the aid of superheated steam. The product, when thickened and vulcanized in the usual manner, is declared to possess all the good qualities of first-class natural rubber. It is recommended that the lighter oils that come over should be separated from the heavier products.

To Tin Zinc.—Make a bath of distilled water, 1 gallon; pyrophosphats of soda, 3½ ounces; and fused protochlorids of tin, ½ ounce. A thin coat of tin can be obtained by simply dipping the zinc in the bath, and one of any thickness by the aid of the battery.

Imitation Marble.—A German glass company near Fredsn, Hanover, make imitation of marble from glass, which, on account of its superior hardness, is preferable for some purposes. They imitate marble tables and floor slabs.

Good Health.

Oatmeal and Milk Diet.

Why are the Scotch people, who drink a great deal of whisky, the best developed, physically, of any of the English race?

According to Dr. Edward Smith, who carefully investigated this subject, their fine bodies are in great part the result of their diet of oatmeal and milk. The Scotch women and children do less factory work, and live more out of doors.

When the writer was in Edinburgh, the celebrated Dr. Guthrie called his attention to the size of Scotch people, and to the fact that the average size of their heads was greater than that of any other nation in the world, not excepting even the English; and when asked how he accounted for this, he replied that he thought it was owing largely to their universal devotion to oatmeal.

Indeed, the writer observed that the national dish was found upon the table at almost every meal, in the houses of the rich as well as the poor. In the morning came the mush, and in the evening the traditional cake, about the size of the crown of a hat, and a little harder than a sun-dried brick.

For further confirmation on this important question, let the writer add that he has found a great advantage to follow the daily use of (honest) brown bread and oatmeal in his family. A child whose first teeth came through in a starved condition, so that they began to decay at once and cause much suffering, is now blessed with as fine a set of second cutters as any one could ask, while the general health of all has improved. In fact, we all vote that we must daily have our brown bread and its twin-sister dish of oatmeal. —*Dr. Holbrook.*

The Pulse in Health and Disease.—Every person should know how to ascertain the state of the pulse in health; then, by comparing it with what it is when he is ailing, he may have some idea of the urgency of his case. Parents should know the healthy pulse of each child, since now and then a person is born with a peculiarly slow or fast pulse, and the very case in hand may be of such peculiarity. An infant's pulse is 140, a child of 7, about 80, and from 20 to 60 years it is 70 beats a minute, declining to 60 at fourscore. A healthful grown person beats 70 times in a minute, declining to 60 at fourscore. At 60, if the pulse exceeds 70, there is disease; the machine working itself out, there is a fever or inflammation somewhere, and the body is feeding on itself, as in consumption, when the pulse is quick.

Tobacco Smoke.—The authorities of several German cities, says *Chambers' Journal*, have been seriously considering the evils resulting from smoking, now so generally practiced by boys. In certain towns, the police have been ordered to forbid all boys under 16 to smoke in the streets, and a punishment by fine or imprisonment is meted to offenders. It has been the testimony of several eminent physicians that the too general and excessive use of tobacco is the main cause of color blindness, now occasioning such great anxiety from its influence upon railway and other accidents, and also upon military efficiency.

The Abuse of Pain.—The little nerves of feeling which run through all parts of the human body carry to the brain intelligence of disaster and of pleasure. The evil messages they bring are called pains. A pain admonishes us that some injury is done to a part of the body—a finger jammed, a toe cut, an arm burned—or that some part is overworked or is wearied out, and must have rest. The nerves but do their duty, when they report faithfully these things, and our duty is to do the best we can to repair the mischief which caused the nerves to report in the way of pain. But many persons are annoyed by these evil messages, and only seek to silence the messenger. The immediate call is for something to "still the pain." Fortunately, the means employed are sometimes such as correct the evil at once, and so put an end to the trouble reported by the nerves. Especially is this the case when cool water is applied to cuts and burns—the relief and the cure begin and go on simultaneously. This same result is usually attained when hot water applications (or fomentations) are made to bruises and sharp pains of various kinds. Pain, which results from overdoing of any kind, is most reasonably "stilled" by rest—general rest of the whole body, and especially rest of the overworked part. Anything that tends to equalize the circulation of the blood, or to make all parts of the body comfortably warm, and no warmer, helps to set the nerves at rest, or to stop pain and disease. Not long ago I saw a man who was suffering with a violent headache (a neuralgic general toothache) furiously kicking, first with one foot and then with the other, working to get the blood from his head to his heels, because he had found that the most effectual way to cure his headache. Cool applications to the head, and hot ones about the feet and legs might serve the same purpose.

Remedy for Burns.—White lead rubbed to a paste in linseed oil. Another good remedy is as follows: Take the best white glue (extra), 15 ozs.; break it into small pieces, add to it two pints cold water, and allow it to become soft. Then melt it on a water-bath, add to it two fluid ounces glycerine and six drachms carbolic acid, and continue the heat on the water-bath until a glossy, tough skin begins to form over the surface in the intervals of stirring. The mixture may be used at once, after the glue is melted and the glycerine and carbolic are added; but when time allows, it is advisable to get rid of a little more of the water, until the proper point is reached. On cooling, this mixture hardens to an elastic mass, covered with a shining parchment-like skin, and may be kept for any time. When using it, it is placed for a few minutes on the water bath until sufficiently liquid for application. (It should be quite fluid). Should it at any time require too high a heat to become fluid, this may be corrected by adding a little water. It is applied by means of a broad brush, and forms in about two minutes a shining, smooth, flexible and nearly transparent skin. It may be kept for any time, without spoiling, in delf or earthen dishes or pots turned upside down.

New Theory Concerning Fever.—A series of experiments have been made by Dr. Horatio C. Wood, Jr., of Philadelphia. The expense of the investigation is borne by the Smithsonian Institution. The experiments indicate that the rapid fall of animal temperature which takes place after section of the spinal cord, is due to paralysis of the coats of the arteries, causing their expansion; whence results an increased flow of blood to the surface of the body, and a consequent reduction of the interior heat. Fever, under this theory, is a disturbance of equilibrium between the heat-producing and the heat-cooling powers of the body. The difference of medical practice that may result from adopting the theory, can be exemplified by the treatment it suggests for sun-stroke. If the patient is in collapse, the hot bath should be applied; if thermic fever has supervened, the cold bath is required. In the first case, enveloping with a higher external temperature may save life; in the second case, cold surroundings may be similarly effective.—*N. Y. Tribune.*

Coloring Matter of Hair.—Mr. H. C. Sorby has succeeded in extracting the coloring matter from human hair. Diluted sulphuric acid he found the best solvent; he found that there are three coloring pigments—yellow, red and black—and that all the shades are produced by the mixture. In pure golden yellow hair there is only the yellow pigment; in red hair the red pigment is mixed with more or less yellow, producing the various shades of red and orange; in dark hair the black is always mixed with yellow and red, but the latter are overpowered by the black; and he found that even the blackest hair, such as that of the negro, contains as much red pigment as the very reddest hair. He concludes from this, that if in the negro the black pigment had not been developed, the hair of all negroes would not be white or yellow, but as fiery a red as the reddest hair of an Englishman.

Weak Eyes.—Bathe in soft water that is sufficiently impregnated with spirits of camphor to be discernible to the smell; a teaspoonful of spirits of camphor to a tumbler of water. For inflamed eyes use milk and camphor, adding a little more of the camphor than above.—*Herald of Health.*

The Week.

Slowly but steadily the conviction is forced upon us that the season is advancing, and that cleaniug-up time is at haud. Lack of water will causo ths early closing down of many mines, hut altogether the run for this season has heen so prosperous and uninterrupted that few have rsason to complain. There is no diminution of activity, hut all the mines, and especially those which havs entersd ths home-stretch, seem straining every nerve and exerting every effort to keep themselves to the front and make a respectahle showing at the finish. Among the southsrn counties, Mono is hecoming sspecially activs. Bodis stocks are crsating a sensation, and it sesms as if the promised "bonanza riss" is to come through thsm instead of the Comstocks.

Inyo, through sympathy, is coming to the frout, and no doubt dcserves the attention hestowed upon it. Siskiyou has suffered in the dsstruction of one of her largest crushing mills hy firs. Butte is again indulging iu the old msthods of machins river bed working for gold, and is confident of success. From Colorado the return wave of disgusted fortune hunters dolefully chants the requiem of Leadville. The "staupeds" reaction—so familiar in California—has fairly set in, and on all sides the papers are denouncing that hsretofore prospective paradise as an unmitigated fraud. Utah plumss herself ou having attracted the attsntion of European capital, and prophesies au immediate improvsment in her mining industries. And finally, ths nsar approach of ths Sutro drain to completion has livened ths Comstocks, and givsn a hrighter and mors cheerful appsarance to the market.

Dealing with the Silver Question.

At a tims when the statis that silvsr should he permitted to occupy in the monetary system of this and other countries is so engrossing the puhlic attention, there ars a few ruling considsrations that should be kept well in view, such as the fact that the aggregate production of the royal metals is now about equal, thers heing little prospect that this relativs rats of increase will soon suffer violent disturhance—also, the fact that the value of these metals, so long as they ars to perform the function of a universal medium of exchauge, cau he affected only temporarily and to a limited extent hy local legislation—that radical laws on this subject are likely in ths end to work only mischief to the power enacting them, etc.

Last year's product of ths precious metals throughout the Far West was nearly equal, the excess of gold having amounted to less than a quartsr of a million—or, to he exact, we give the figures, gold $38,956,231, silver $38,746,391. This covers all the hullion-making territory in ths United States, British Columhia and a portion of northwestern Mexico. During the preceding two years the silver product of these countries was a trifle larger than the gold, owing to an unusually large output of the former metal hy the Bonanza mines on the Comstock lode. But this was an ahnormal stats of things and will not probahly find early repetition, at least on the Comstock range, since, even though other honanzas hs opened up, the tendency thers is to a preponderancs of gold with depth attained. What may comc of Leadville and other silver-yielding localities in Colorado will probahly he offset hy tho increased output of gold that may be expected from the Black Hills region, from the Snake River country and from the Bodie and other mining districts in Californuia. Unless the price of lead shall appreciate silver production must continue restricted iu Utah, and may even suffer some curtailment in the lead-silver producing districts of Colorado and New Mexico, as it has already done in Inyo county, California. While such is ths condition and outlook of the bi-metallic question on this coast, Australia, Africa and Siberia, the other principal gold-producing couutries of ths world, will undoubtedly go on, as heretofore, turning out that metal exclusively. In so far as Mexico and South America are concerned, thcy yield the royal metals, as a whols, in about equal quantity, and should tho business of mining in thoss countries undergo further expansion, as it probably will, this equilihrium will not be likely to suffer much disturhance.

Look where we will everything points to a maiutenance of the present nearly equal production of gold and silver, arguing the fitness of their joint retcntion as agents for effecting exchanges and measuring values. As recently, so doubtless in former times, has the monetary world heen perturhed through the discovery of new and extensive mines of gold or silver, exciting fears of a sudden and excessivs production of one or other of these metals. Such we may suppose was the effect caused hy tbe discovery of the Mexican and the South American minss, as we know it was in the case of the finding of gold iu California and Australia and of silver in Nevada. But this increass of the precious metals, while it has stimulated and expanded many interests, has had no seriously disquieting effect, financial, commercial or industrial, hsing nothing more than was required hy the growth of business and population. If it has tended to advance pricss, such advancs has heen gradual and universal, causing no jar or injury to business in general.

It is apt to hs the case, too, that the magnitude of thess discoveries is at the first overrated and their effect prematurely discounted. A great find of the precious metals excites the attention of mankind more than would the creation of a like amount of wealth by other means. The value of the gold and silver turned out hy the mines of California during the entire 30 years tbey have heen worked, is small compared with that of the cotton. the wheat, or other of the great cereal crops of ths Unitsd States. When the Comstock silver mines were discovered, the most extravagant notions of their wealth obtained and, spreading ahroad, produced uneasiness everywhere as to the effect this threatened deluge of silvsr might have upon this metal for currency purposes.

It looks now as if the hullion yield of the world promised to ahout keep pace with the expansion of its other industries; while the evenness with which gold and silver are likely to he produced suggests the wisdom of a hi-metallic policy, on our part at least. If we can induce England and all other countries to adopt a similar currency so much the hetter, as this will tend to harmouizs the silver market everywhere and croats an outlst for that metal, of which we are destined to continue the principal producers.

Thirty years ago, when gold thrsatened to largely predominats, the monometallists of that day voted for its deposition as a money metal, just as, under reversed conditions, they now advocate the demonstizatiou of silver, crcating the impression that they hslong to that class of extrsmists, who, though honest enough, ars too easily alarmed to hs safely trustad. France, with a hi-metallic currency, is to-day notoriously the most prosperous country in Europe, while England and Germany, adhering to ths gold standard alons, are suffsring such industrial depression as has caused them to seriously contemplate the restoration of silver to its old offics.

Of the much that is being said, hoth in and out of Congress, about the free coinage of silver, limited legal tendership, increasing the valus of the silver dollsr, suhsidiary currency, etc., a great deal is, no douht, inexpedient, if not visionary and mischievous. It would hs to tbe intsrest of the peopls of this coast to have silver forced into large uss irrespective of the agencies employed to effect that object. But ths desire is not general hers that recourse should hs had to other means for accomplishing that end than such as are in entirs consonance with the public good. We do not seek to have silver made a legal tendsr to an unlimited amount, nor ask for its free coinags if it is to work a henefit to us only at ths expense of other sections of ths country. Against the proposition to increass ths value of ths standard dollar from 412½ to 460 grains, we would protest as likely, if carried into effect, to soon so depreciate that metal as to deprivs it of its money function altogether. Our staudard dollar contains now more silver, proportionally, than the five-franc piece, of whicb there are in circulation at the present time over $1,000,000,000 in Europs. Compared with the silver money of ths Old World this is an honest enough coin, as it certaiuly is a very useful ons. Our hard money currency is now in a healthful and satisfactory condition, and the less tinkering done upon it the hetter.

New Method of Obtaining Metallic Copper.

In places where leaching is carried on whsre copper is obtained on a large scale iu a solution from which it has to be precipitated, it is usually dons in a large cylindrical vessel in which pieces of iron are placed. If not donc in this way the solution is placed in a vat in the bottom of which scrap iron is thrown, and thsre left until the iron precipitatcs the copper in a metallic form. In these methods, the iron has to he removed before the copper can he taken out. The copper precipitates on the irou in the tanks or cylindrical vessels, in such a manner that it is difficult to separats ths metals.

Cyrus C. Bitnsr, of Speuceville, Nevada county, has rcently patented through the MINING AND SCIENTIFIC PRESS Patent Agency a novel method and apparatus for producing metallic copper from its solutiou, to obviats thess difficultiss. It consists in the smployment of a tank or vat having a horizontal perforated diaphragm upon which is placed a quantity of irou. This tank is filled with a solution of copper previously prepared from the roasted ore in the usual manner. Through ths top of this tank a steam pipe passcs and extends helow the diaphragm, so that the solution is heated hy this injected steam, and by tbs motion which its action gives ths deposition of the copper is hardened. By means of peculiarly arranged slides the steam may bs admitted abovs the diaphragm through tubes in the steam pipes. In Mr. Bitner's process the chemical action is the same as formerly, but the details of construction of ths tank and operation of the steam, are such as to facilitate the work.

The copper solution is drawn into an ohlong tank which is provided with a cover, and strengthened hy supports aud tie rods. Extending entirely across this tank, a short distance ahove the bottom, is a wooden grating or perforated diaphragm. In the center of the tank is a square npright wooden tube, the hottom of which is closed. Perforations are made at diffsrent points in ths tubs, aud steam is injected on the top of said tuhe which may pass out of any of the perforations which may he open. The lower pcrforations are under the horizontal grating, and the steam ordinarily passes out of these openings, but when it is desired to allow steam to come out ahove the grating, ths operator has it under control. This control is sffscted hy slides fitting in dovetail joints formed hy the corner pieces. These slides have ruhher faces and may he slid up or down as the opsrator desires. As they ars slid up the tuhes are opened at any desired point, and the pressure of steam cannot press them out.

The scrap iron is thrown down on the perforated diaphragm or grating and the solution admitted to the tank. The iron precipitates the coppsr in ths solution, which action is facilitated hy the heat furnished hy the steam. As the copper precipitates some of it falls to ths hottom of the tank and some of it on the iron or on the grating in the upper chamher. After the solution has heen drained off, hy running the slides up and allowing the steam to escaps from higher orifices, the steam blows or washes the precipitated copper from the iron and throws it to the hottom of the tank.

Ths precipitated copper may he washed out of the tauk through a suitable openiug, which is usually tightly closed on ths outside by a plug and wedgs.

By this means the copper is precipitated from a solutiou, and it may he removed from the tank without rsmoving ths iron, said iron heing cleansed hy the steam. Steam may he turnsd off at any moment during ths precipitation if desired. The steam will agitate the solution in such a manner that the precipitated copper will he washed rapidly from the iron and fall through the grating to the bottom. Mr. Bitner says he can precipitats a tauk full in thrse hours. Cost of constructing apparatus ahout $75.

The Unemployed and the Mines.

Ths city continues to swarm with men wholly out of work, hesides many who are but partially smployed and poorly paid. Having waited through the winter and spring, holding on in hopes of a change for ths hetter, the summer approaches without hringing these men more labor or improving their prospects. It hecomes, indeed, every day more and mors evident that if they are to get work or find places where they can earn stesdy and even the smallest wages, they will have to seek them elsewhers than in the city, the mines affording thsm perhaps ths best openings for doing so. We say this, not that ths mines present now anything very enticing to men in search of essy situations or mors than moderately good wages. Thers is in the mines at ths present day only low prices with small averags sarnings. To find there now paying claims open to location is no easy matter. Still, there is not in the mining districts the ssme destitution, over-crowding snd utter impossihility of getting a day's work and earning an honest living as in the city. Besides, once out in the country, men are not so apt to fall into loose habits or have recourse to disreputahle shifts for getting along.

In leaving the city for the mines it is not hest as a general thing for men to go without soms previous preparation, nor should they go wholly alone, especially whsre they have had little or no expsrience in this sort of life. We pointed out a week or two since such sections of the mining regions as sesmed to afford the hest openings for men seeking employment or for opportunities to employ themselves, suggesting also a plan of proceedure that if adopted would he likely to facilitsts their labors and tend to insurs for their undsrtakings a mors complete success.

That plan was for lahorers and parties of small means, heing out of employment, or who, for other reasons, might wish to go to the mines or hecome interestsd in the business of mining, to combine their means, and forming themselves into small companies, send out into the minss two or three of their number to hunt up and sslect there the hest locality they could find for a small party to engago in mining, looking out at ths same time for any chances they might see or hear of for meu to get employment on wages. For this scrvice the men hest fittsd hy experience and other qualifications, would, of courss, he selected. Generally speaking, California opens the bcst field for working men or others possessed of hut small means to engage in mining, hecause here ths mines can bs reached at least expense, while ths climate is healthisr, living cbeaper, and the facilities for starting and carrying on the business hetter than elsewhere. Then mining here takes on a greatsr variety of forms than in any other part of the country. We have iu this State a great extsnt of placer diggings, some of which require to he worked hy drifting, and others by the sluice or hydraulic process. There are here river heds to he laid hare and washed with great quantities of tailings that can he profitahly rehandled, ths gold-hearing quartz veins ahounding from one end of ths State to the other. Ths tailing deposits that would pay for re-washing are found in greatest quantity in the tier of counties reaching from El Dorado to Plumas. Tuolumne, Calaveras and Amador afford good chances for engaging in quartz mining in a small way; though Siskiyou presents perhaps the hest opening for this business, ths disadvantages heing that it lies a good way off, and can bs reached only hy long wagon transportations over a high range of mountains. Still, it is a good county to go to, hsing well supplied with wood and water, and possessing other mineral resources hesides its quartz veins.

Parties having some considerahls moncy might repair to the Snake river region with fair chance of doing well; hut it is sxpensive getting there, while it will cost at least $1,000 to inaugurate a successful mining operation on that stream. Mono county is full of good lode mines, hut it takes money to open them, and ws fear the chances for a poor man there would he nons of ths hest.

For washing ths tailings so plentiful in ths mors central mining counties, very little mouey for outfit is required, this husiness being prosecuted hy means of sluices and sometimes with only the old-fashioned rocker, with which implemsnt the Chinese manage often to make good wagcs. It is also possible to start a quartz mining opsration with very little capital, the arastra heing in this case used at first. There is no troubls in finding quartz almost anywhere along the main gold helt of California that will pay five or six dollars to the ton. With two arastras that can he huilt for $50, and a horse or mule to drive each machine, three men can take out and crush four tons of ore daily. The entire cost of an establishment of this kind, tools, cabin, etc., included, need not exceed $200 or $300, whils the daily net profit of running it would average $15 at least. Thousands and tens of thousands of industrious, temperats, frugal men, could in this manner maks small, hut sure and steady wages in the gold fields of this State, and while doing this they could get hold of valuable mining properties, secure a pisce of land, make homes, and live a healthful, free and independent life. If only this class of men will take to the mines, observing some such method of procedure as here suggested, they will in the end have ahundant reason to he satisfied, and will in most cases bs themselves surprised at thsir own success.

Operations of the Signal Service Bureau on the Pacific Coast.

"Old Probabilities" very quietly made an extended reconnoissance of the Pacific coast a short time ago, unknown in his modest incognito to almost every body. This happened in part at least from the fact that the old gentleman is a complicated personage. It is impossible for one man—the able chief of the Signal Service, General Myer—to attend to the entire direction of the Bureau, and at the same time to all the details of studying and making out, plotting and publishing the weather likelihoods for so large an area of the earth's surface as is covered by the United States. In the general office at Washington there are several other persons whose special duty it is to take the collated data, and deduce therefrom the probabilities, dividing the work between them.

One of these persons is Lieut. Robert Craig. Thoroughly familiarized with the air currents, cloude and storms, they have a romantic existence, dwelling in a higher sphere [or place then ordinary plodding mortals. Their minds and souls are always traveling upon the whirlwind. They rest npon the clouds; they are unceasingly sliding from one stratum of the atmosphere to another, mounting to the loftiest hights of the "cerulean blue," and delighting above all things in the surprisee which they are able to create among the busy populations, unable to look beyond their own horizon. If they can hurl upon us (as ie their daily wont), an unexpected storm of wind or rain, it is to them a delectation.

Worn and wearied finally by this kind of life, followed for many years without respite, Lieut. Craig last fall obtained leave of absence, and recuperated his bodily energies among the nooke that furnish congenial surroundings for such a spirit, on the Pacific coast, along which in the course of three or four months he waudered from Lower California to British Columbia. Naturally enough the epirit of Old Probabilities made its presence known as flitting over this region to him who toils on the PRESS. Our interview—or sesnce if the reader likes—took place at the Baldwin hotel in March last. Lieut. Craig returned a few days later to Washington, where, remounting the tripod, he has since been flourishing the scepter of Jove in the shape of a crow quill over his weather maps.

Before the Signal Service Bureau was organized this gentleman observed to us, that very little was known of these areas of low and high pressure on an extensive scale. They had never made any simultaneous observations. Espy made some deductions, but he drew simply a straight line—a tremendous trough representing low pressure. But he did not have the data to work upon. Considering what he had, he accomplished all that could be expected.

The Signal Service observations are now taken three times a day all over the country at the same moment. The observation at 7:35 A. M., Washington time, is taken simultaneously all around the world. In remote outside regions where there is no telegraphic communication the results are transmitted by mail, and used in the course of the year in a more general way and with good effect. The results of a general character are published from time to time; and the more special daily, in the printing office of the Signal Service Bureau. Every month the Bureau prepares and publishes a monthly review of the United States, wherein are charts, giving the directions of storm centers.

Every storm that crosses our country is noted, with a short description and charts. These reports are familiar to many of our readers. They come out about the middle of each month and may be seen at all the regular and volunteer signal offices on the coast, as well as at other places where they have been desired and arranged for. There are 400 or 500 volunteer observers in the United States. In return for their services these reports are sent to all observers.

On the Pacific coast the extension of the service beyond the confines of California is new. The probabilities for the coast have not been daily studied and published until the past year, when regular offices were established as far north as Olympia, W. T. As both the regular and volunteer offices have been constantly multiplying since, we are unable to furnish a complete list. Many thousand square miles, however, of the Cordilleran plateau and Rocky mountain country are not yet represented.

The mountain ranges have not such a decided influence on high and low pressure centers governing the movements of storms, as would be imagined; in fact, very little, though they have great influence on the storm itself, after it has been created. The high mountain ranges simply take out all the moisture, which is the fuel of the storm, and keeps it going. As a storm approaches the Sierra Nevada, for example, the rising of the atmospheric stratum into a colder hight, causes deposition in the form of rain or snow. Mountains and valleys have a good deal to do in shaping the direction of the winds of the lower atmosphere, being those with which we are acquainted. Rain storms once generated and moving in any direction close to the surface, are subject to deflections just like the winds without rain.

It so happens that the winds blowing into the Golden Gate agree in direction with the course of the general atmospheric current in this latitude. No sooner do they reach the interior valleys than their courses are altered from the northwest to southeast. Storms generally move from west to east in the latitude of the United States, between 25° and 75° north of the equator. The storm centers which affect the North Pacific coast strike the same approaching from the west, at all points between the parallels mentioned. The rain storms are just as likely as not to strike the coast south of San Francisco, though the majority strike it to the north of that point. Some of the California rain storms come here from Oregon and Washington. What proportion originates north of the Columbia, observations have not been made to show.

The southerly winds of winter are produced by a depression—a low barometer—north of us, while it is high to the southward. The rains, where they occur on the coast in summer time, have the same general direction of movement as those in the winter. The directions of the wind preceding rain may vary according to the season. When, for example, the wind here is from the south people say they are certain to have rain.

THE REGION OF THE THOUSAND WELLS, ECHO CLIFFS, ARIZONA.

What brings the rain storms down the coast is not always clear. Sometimes the Signal Bureau observers can see certain indications of causes to make them so move while at others they find it impossible to explain why they should take that particular direction. The Oregon rain storms frequently take this course nearly to the southeast, instead of the normal course directly to the east. Sometimes there is in advance of the normal movement, eastward beyond the Rocky mountains, an area of high pressure which would cause them to turn southeastward.

There are three different storm belts. From the equator to latitude 25° or 30° north, storms move from the southeast to the northwest. In our latitude they move from west to east. North of us, somewhere in the neighborhood of 65° or 70°, they begin to move from the northeast to the southwest again. These belts shift up and down a little according to the season. Loomis's Meteorology states the phenomena and their causes. He gives these as the prevailing currents all over the globe. Generally speaking, the normal direction of the belt current rules the direction of the storm movement; but the low pressure areas or storm centers are still more strictly governing as to details, while following themselves the movement of the prevailing winds. Our north winds are sometimes winds which follow a storm as it passes away. At other times they are winds preceding what is called a high barometer.

In our next issue we will take more particular notice of the movements of storm centers common to the regions along the Pacific coast, with those of the plateau of the Rocky mountains and beyond; the philosophy of the dry season on the Pacific coast; the nature of the precipitation in the desert regions of the plateau; exceptional instances; and of the increase of rainfall in certain parts since 1849, etc.

THE proprietor of the Pullman car invention reports that paper wheels have run 400,000 miles under his cars without repair, while the average running power of an ordinary wheel is from 55,000 to 60,000 miles.

The Thousand Wells.

Our engraving gives a glimpse of a very interesting region on the Colorado river in northern Arizona. It is, as may be seen, a wild region, the surface being deeply furrowed or eroded, as the geologists say, and shows the work of great grinding and wearing agencies in the years agone. This piece of landscape includes a few of many remarkable natural formations known as the "thousand wells." They are located on the western slope of the Echo cliffs. Powell says this slope is composed of homogeneous but rather friable sandstone, and the rain-water rills have corroded deep channels, interrupted by many pot holes. After a shower these pot holes are found filled with water. There is a place near by the trail which passes from the mouth of Paria to the province of Tusayan where there is a collection of these water-pockets, known as the thousand wells. These wells are used by the Indians as water sources during their wanderings, but the chosen abode of the Indians is on the eastern slope of Echo cliffs, where numerous springs are found which are their famous watering places.

MAKING SILVER.—Once more the old delusion or deception that gold and silver can be made by compounding other substances, has been revived and palmed upon the public. This time the alchemist is a Dr. Thomas Farriss, of Mt. Pleasant, Ohio, who alleges that he discovered his secret while at college. He noticed that certain waste washings in the laboratory had accidentally precipitated a metallic substance, which, on examination, he found to be silver. For a number of years since, he has been experimenting to produce this same substance. He now claims to have succeeded, and is manufacturing silver on a small scale for the benefit of his friends. The materials and process used by him, are, of course, kept in profound secret. Without doubt they will remain so—such things generally do. He succeeds well with his assistants, and yet they are reported to be utterly ignorant of chemistry. This fact is calculated to attract and impress the ignorant, but to the scientific observer it savors strongly of charlatanry. If his assistants were experts, the Doctor would not be able to use lunar caustic, or the so-called horn silver or any other such compound, from which it is easy to make silver. It is undoubtedly the same old story told again.

YOUSE'S IMPROVED PISTON PACKING.

THE MECHANICS' FAIR.—The coming Mechanics' fair promises to be an improvement on any heretofore held. Applications for space by future exhibitors are more numerous than ever before so early in the season. There are new features under consideration, which, if carried out, will add greatly to the attraction of the coming fair. In view of the increased requirements of future exhibitors, an addition is being made to the pavilion at the end toward Mission street. The interior arrangements of the pavilion generally, are also to be changed—even to the music stand and the fountain. The machine space will also be enlarged in expectation of larger exhibits of mining and other machinery.

An Improved Piston Packing.

We illustrate herewith an improved piston packing, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Samuel A. Youse, of Sutter Creek, Amador county. The improvement is in that class of engine packings in which the packing is effected by the action of steam under pressure, which is allowed to enter the interior of the piston at each stroke and thus force the rings out to a bearing. It consists in a novel combination and arrangement of a series of three part external expansible rings, upon an interior externally flanged body, which is in turn supported upon or surrounds the spider. This body has circular grooves surrounding it centrally beneath each broad ring, and these grooves receive steam through passages from each end of the cylinder, so that the rings upon that side of the central flange only will be expanded by the action of the steam during the portion of the stroke upon that end of the cylinder. A peculiar spring is employed at the bottom of the piston when moving horizontally, whereby the piston head and follower are prevented from falling upon the side of the cylinder when running without steam, and thus wearing it out of true.

A is the piston head, *B* the spider, and *C* the body of the piston which is provided with a central flange, *D*. The rings are composed of three parts each; a broad ring which fits the body of the piston, and two outer rings, *G*, which are fitted upon the outside of this inner ring. Each of these rings is made in a single piece with one cut, so as to make them elastic. The body, *C*, of the piston has grooves, *H*, turned upon each side of the central flange, *D*. These grooves lie beneath the center of the rings, *H*. Inner rings and holes, *I*, are drilled so that the grooves, *H*, will connect with similar grooves, *J*, which are formed on the edges of the part, *C*. When the follower is in position these grooves, *J*, will lie against the head, *A*, and follower respectively. Holes through the head and follower admit steam to the grooves, *J*, and from these, holes, *I*, admit it to the grooves, *H*, in the face of the body, *C*. The ends where the rings are cut are made to break joints so as not to leak steam, and as the inner ring has its center over the groove, *H*, the pressure will be central and there will be no side pressure by reason of the steam being admitted beneath one side or the other of the rings. Before admitted centrally it will be distributed equally outward from the groove, which is of advantage in steadying the rings and equalizing the pressure.

The flange, *D*, fills the cylinder like the piston head and follower, and the rings are thus held in place, one set upon each side of this flange. In the drawing one set is shown in place and the other set removed to show the head. Steam being admitted to the cylinder it will enter the small holes upon that side of the piston, and passing through the channel, *J*, will enter the holes, *I*, and grooves, *H*, thus expanding the rings upon that side of the flange, while the rings upon the opposite side will remain loose. The reverse action takes place upon the return of the piston. The interior rings have each a pin projecting from them, and the double outer rings have corresponding grooves which fit the pin, preventing the rings from changing their positions.

In order to support the weight of the piston and prevent its dropping on the side of the cylinder, where it will wear the cylinder out of true when running without steam, as in locomotives, going down hill, a single adjustable spring is fitted within the spider, as shown, and it serves to keep the piston head and follower up by its elastic ends resting upon the body, *C*.

By this construction the inventor is enabled to simplify the steam packing. It economizes the steam employed by means of the grooves, producing a pressure outwardly from the center of the rings, which equalizes the pressure and the wear. An improved compound ring is provided, and the wear of the piston and cylinder is reduced to a minimum. The device is simple in construction and operation.

MACHINERY FOR ARIZONA.—Mr. H. W. Rice has just shipped from his engine and boiler works, No. 56 Bluxome street, machinery for a large saw mill, which is to be erected in a timber tract on the mountains of that newly developed country, Arizona. The size of the engine is 12x24, and it is one of the finest ever produced upon the Pacific coast. It is provided with automatic cut-off valves with latest improvements in valve gear, piston rings, crosshead, guides, rod guides, boxes, etc. The boiler is made of the best material, and is provided with pumps and heater of best patterns, and all that is necessary to make it a complete outfit. The boiler was tested on the yard and is calculated to develop fully 40-horse power. The boiler, as well as the engine, shows that it was made by skillful and experienced workmen. San Francisco may justly be proud of her mechanical industries, and it is well for our neighboring States and Territories that we are able to supply them with improved machinery as well as other manufactured articles possessing qualities not to be surpassed by any country in the world.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

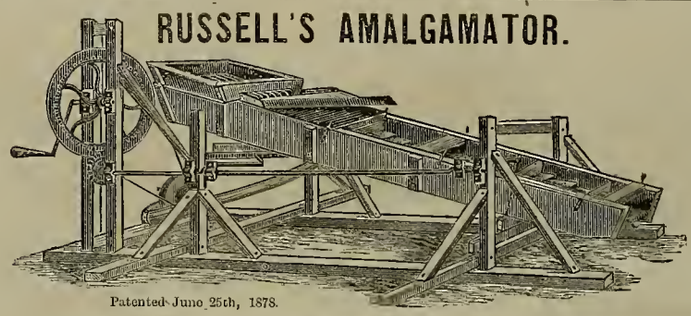
RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

J. MORIZIO, Gen'l Agt.,

Room 24, Safe Deposit Building, Corner Montgomery and California Streets, SAN FRANCISCO.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Boswell Fruit Drier.

Operated by Deflected Heat.

STANDARD SIZE,

Capacity, 500 lbs.

PRICE, $75.

A Cheap and handy Drying Machine, within the reach of every farmer and fruit-raiser, with which they can dry their own fruits at home, without extra help and at very small expense. Fruit can be taken DEAD RIPE and successfully dried in the Boswell, because the atmosphere in which it is dried is heated by DEFLECTED HEAT AND RETAINS ALL THE OXYGEN IN ITS PURE STATE, which is as essential for preserving the fruit as for its growth and maturity on the tree; besides, the entire nutriment and flavor are retained. Fruit dried in the Boswell will gain from 20 TO 40 PER CENT. IN WEIGHT and 30 PER CENT. IN QUALITY over any other method. Also,

COMMERCIAL DRIERS,

With capacity for drying from 1,000 TO 4,000 POUNDS, at special rates. Also

Boswell's Heater, Cooker and Drier

Combined for family use. And

Boswell's Pure Air Heater,

In cabinet, iron or marble case, any size, for heating public Buildings, Hotels, Halls, School Houses, Churches, Hospitals, Railroad Cars, Stores, Offices, Private Residences, etc. Will heat evenly the entire building with PURE AIR, and with ONE-THIRD the quantity of FUEL required in any other Heater. Send for price list and circulars to the

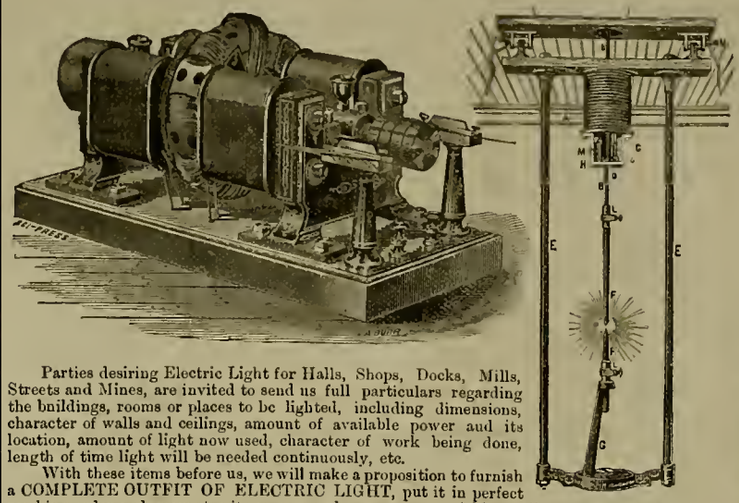
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.
With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO.,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock-Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

Dewey & Co {202 San-some St.} **Patent Ag'ts**

Continued from page 349.

in North Bonanza grouod was nearer the ledge than was supposed, so that some ore has been disclosed in it.

North Con. Virginia.—Sinking is making about two ft per day during the time that the work of putting in new guides and fitting the shaft for use of skeets is going on. The bottom is 72 ft below the 1700 level.

Alta.—Running both north and south from the station on the 1750 level at the bottom of the joint Benton incline winze, preparatory to crosscuttiog oo that level.

ESMERALDA DISTRICT.

A General Prospecting Shaft.—*Herald*, May 24: The committee appointed by the citizens oo the 2d of this month to examine the various locations in this mining district, and to report and recommend the most suitable place to sink a shaft, request us to state that they have secured the best piece of ground in this section, and also that every arrangement is nearly completed to the early carryiog out of the proposed project. We expect soon to be able to give tho full particulars in regard to the exact location of the ground selected, and all other desired information in connection with the movement.

EUREKA DISTRICT.

Eureka Con.—*Sentinel*, May 25: The following work has been done in the several levels: 5th, the east drift has been continued 28 ft, and is now in 114 ft; 7th level, the northwest drift has been continued 50 ft, and is now in 100 ft; 11th, the west drift has been continued 45 ft from the ore chamber; 13th, the east drift has been continued 19 ft, and is now in 77 ft. The west drift has been continued 10 ft, and is now in 30 ft. The incline has been sunk 21 ft, and is now down 405 ft below the station.

Hamburo.—West crosscut, 600 level, has beeo advanced 12 ft, making a total of 312 ft. The rock in the face is considerably harder than usual, but blasts well. East crosscut, 600 level, is now in 54 ft. The cross vein followed is now running nearly southeast, which they hope will soon lead to the main north and south vein. They have shipped to the Richmond furnaces, duriug the week, 57 tons of first-class ore. Have found some very rich ore near the old Hamburg shaft, about 20 ft from the surface, which gives every indication of opening into a considerable body.

Fourth of July.—The north drift from ths cave above ths lower tunnel level bas been advanced 22 ft, following the vein which shows a large mass of iron, low-grade ore and about two ft of extra good orc in the footwall of the vein.

GOOD HOPE DISTRICT.

Jottings.—*Silver State*, May 25: The mines here are looking well. The ledge in the Aurora has widened out considerably of late and the prospect for a paying mine is more flattering than ever. From the U. & I. mine some exceedingly rich ruby ore is being extracted, exceeding in value the samples recently tested in Salt Lake City. Work in the Buckeye progresses slowly, the rock becoming harder as the drift is advanced. A rich ledge was recently discovered in the district and will be worked this season. All of the men in camp feel greatly encouraged by the late developments.

Blue Jay Ore.—Messrs. Bradley & Hunter have brought several sacks of ore to town from the Blue Jay mine in Silver State district, for the purpose of shipping it to Salt Lake to have it worked. They expect it to work not less than $500 to the ton.

PARADISE DISTRICT.

Spring City.—*Reporter*, May 24: The Paradiso company is doing uothing outside of running a prospect tunnel. It has sufficient ore on its dumps to run the new mill several months. The Bullion mine has suspended for the present. The Big Prize company is taking out ore and shipping it to Torrey's mill. The Gulch claim is being opened rapidly, and is showing some fine ore. The Mount Rose company is opening its mine by running in its lower tunnel, which is now in 65 ft, showing indications of getting ore soon. The camp is very dull at present, but good times are looked for soon.

ARIZONA.

Oro Blanco.—Cor. *Citizen*, May 23: Oro Blanco mining district is still in *statu quo*. The warm weather has in a measure, retarded work. Mr. J. H. Haskell has employed a number of mon to sink on some mines located by Mr. J. M. Kirkpatrick, and situated about five miles northerly from the Ostrich mill. Three mines there are to be developed at once to a depth of 150 ft, the work to be prosecuted with true California vigor; no rest day or night. The mines are reported to average well, with large quantities of ore of sufficiently high grads to pay well for milling. The district needs a mill for reducing silver ors. Such would be equally beneficial to mill owners and miners. Large quantities of ore are now on the various dumps, and the mine owners are virtually prohibited, by want of means, from further developing their mines, whereas if a mill was in operation, the ore is rich enough in many instances to pay all expenses of working and yield a handsome profit besides. Messrs. Haraszthy and Smith, on their California and Monitor claims, have ore rangiog from $100 to $1,800 per ton, but without a mill their dumps represent only so much rock, they having no facilities wherewith to extract ths precious metal. Messrs. Flood, Kirkpatrick & Co., aod maoy others, are similarly situated. The Ostrich mill is at present only fitted up to put through gold rock, and while the owners aod the enterprising lessee, Mr. Hogg, realize the importance of having silver reduction works attached to their mill, and the financial benefits that would accrue themselves thereby, they feel that at present they do not have the meaos to warrant the necessary very heavy outlay. The Arivaca mill, which intends to employ the lixiviation process, is working but slowly to that end, and five or six months will probably elapse before they will be prepared to receive silver ore.

IDAHO.

Notes.—*World*, May 23: Henry Van Horn is about to make the transfer of his entire interest in the Yellow Jacket mine to a San Francisco company for a good round sum—the exact amount is not known. The company will erect a 40-stamp mill as soon as the transfer is made. A very large silver mine has been discovered on the South fork of Salmon river, 30 miles southeast of Challis, Lemhi county, by Mr. H. Lester and others. It has been located for two miles, and a road is being built to it. It is thought that the discovery will lead to the opening up of another important mining district. Messrs. George Brown, Edward Carr and William Tucker are at work on the Buzz Fuzz mine, discovered by them this side of the Elk Horn. As far as the ledge is developed it is a foot wide and the ore worth $25 to $30 per ton. The rock is of a white character, and contains some antimony. A Tuscaroan in Bonanza City writes that the snow is still very deep in that vicinity. Scores of miners are arriving there and at Challis daily, and when the snow melts, many of them will be employed to work on the claims located and partially developed last fall. Money is plentiful and Bonanza City will be the liveliest camp on the coast this summer. The Channell ditch has been opened and the water started through it. Work has been commenced in the extensive claims owned by Channell & Travis, on Willow creek.

Mrs. Daniel V. Stone, of Boston, has giveu $25,000 to the Young Mon's Christian Association toward ths erection of a new building.

President Grevy bas signed pardons for 400 more Communists.

Gen. Grant and party expect to arrive in California in July.

William Lloyd Garrison died at New York Saturday night.

Patents and Inventions.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co.'s Mining and Scientific Press Patent Agency.]

By Special Dispatch from Washington. D. C.

For the Week Enoing May 20th, 1879.

Rotary Ore Roaster—T. H. Blythe and Morey, S. F.
Targets—Wm. H. Broden, Webb's Landiog, Cal.
Fog Horn—E. T. Bucknam and H. C. Langrehr, S. F.
Seam for Shoes, Etc.—Jno. Jory, S. F.
Oil Cups—A. D. Hilborn, Oakland, Cal.
Steam Boiler and Furnace—M. N. Laufenberg, S. F.
Water Lifter—L. B. Lawrence, Monticello, Cal., and A. G. Strawbridge, Sharon, Pa. (2).
Single Propeller Pump—Oeo. Norton, Stockton, Cal.
Sample and Button Weigher—J. S. Phillips, S. F.
Engine Fire-Lighter—C. E. Thompson, Stockton, Cal.
Car-Truck—Harry S. Zink, Martiuez, Cal.
Air Compressor—J. B. Pitchford, Gold Hill, Nev.
Feathering Paddle—Chas. F. Winsor, Seattle, Washington Territory.
Lantern—Jno. Gilleg, Virginia City, Nev.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Apparatus for Target Practice.—Wm. H. Broden, Webb's Landing, San Joaquin county. Dated May 20th, 1879. This invention relates to an improved apparatus for target practice, which the inventor calls the "Practical Wiug Shooting Armator," and it is intended to present several movable objects at which to shoot, each moving in different directions or at different speeds, to represent the motion of different varieties of birds. The various devices are arranged at different elevations, so that practice may he had at surface shooting, or high shooting, and the objects may he moved in different directions and at differsnt speeds, so as to furnish a variety of moviug objects. The various objects are moved by a series of pulleys or belts and the objects themselves, in form representing different birds, may he made partially of metal, so as to give out a ringing sound when struck, and partly of paper, so that the fact of hitting the target may hs recorded. Witb these differently arranged devices operating from ths same power shaft, practice in several ways may be gained. Novices may learn to handle a gun properly under differsnt conditions and good shots may keep in practice without having to go to the field.

Fog Horn.—Buckman & Langrehr, No. 22 Steuart street, San Francisco. Dated May 20th. The invention relates to au improved fog horn, such as is used as a danger signal on sailing vessels in foggy weather. The improvements consists in providing a removable mouthpiece and in the peculiar construction of the reed-sounding apparatus. The reed is secured in place hy a screw, so as to be easily removable for cleaning or replacement, and its position on the mouthpiece is such that its vihration is rendered certain and the sound produced sonorous in its tone. It further consists in a peculiar formation of a mouthpiece which surrounds aud encloses the reed stem so as to provide an enclosed surrounding hody of air, which is set in motion by the act of hlowing and greatly augmonts the volume of the tone. This horn may he blown with eass and will make a noise loud enough to be heard in foggy weather a distance of a mile and a half or more, according to size. The inventors have made a great many for use on our coastiug vessels.

Hydraulic Water Lifter.—Lawrence & Strawbridge, Oakland, Cal. Dated May 20th. This novel watsr-lifting apparatus consists of a boiler or receiver which is set into a heating furnace, and has a pipe leading from near the hottom to a tauk situated above it. A float situated in the hoiler operates a valve which closes an opening in the uppsr part of the boiler so that the pressure of the steam gsnerating within the boiler will force the water into the upper tank, thus driving out tne air from this tank into the water-lifting tank helow. When the water in the hoiler is lowered to a certain point, the float will open the valvs and allow the steam to escape, thus relieviug the pressure and allowing tbe water to flow back from the upper tank into the boiler. A jet of water enters ths upper tank and cools it sufficiustly to relieve the water tank from pressure and allow it to fill again through a valve. In combination with this apparatus, the inventors employ a novel heating device.

Car Axle.—Harry S. Zink, Martinez. Dated May 20th. The construction of this truck is such that each pair of wheels is independent of the other in turning curves. It cousists in forming the truck with the usual central beam, having the trusses or frames extending out so as to enclose the outside boxes, in which the ends of the axles turn, in a manner similar to that ordinarily employed. Midway between the wheels is a supplemental truss with boxes whicb receive the center of the axles. The axlss are divided in the center so that while they are in line with each other and each pair of wheels will run as if upon one axle, they may havs an independent movement when turning curves, and each semi-axle will be supported at each end.

Seam for Boots and Shoes.—John Jory, S. F. Dated May 20th. The invention consists in grooving one side of one piece of the leather and stitching the edgs of the othsr piece to the inner edge of the groove. This piece of leather is tben hound over so that the seams will fall into the groove, and is stitchsd upon the opposite side so that the seam is neat and smooth with the heaviest leather. The groove receives and protects the seam from friction, and the seam may be mads either with or without a stay, or with or without a cord.

Water Lifter.—Lawrence & Strawbridge, Oakland, Cal. Dated May 20th. The invention is another apparatus for lifting water, by means of a pressure of a column of air in excess of what is needed to drivs the hot-air engins, by which the column of air is compressed, or in other words, the whole power of the engine is employed to compress air, a small portion of which is carried to the heating furnacs and expanded to drive the engine, while ths remainder is carried to the apparatus where it is to he applied to the raising of water.

News in Brief.

Eureka, Nev., has the measles.

Cetawayo is thrsatening Natal.

Tramps are committing hurglaries in Chico.

California has caught the "archery fever."

Last Saturday was Queen Victoria's birthday.

Over 1,200 mon are employed in the Sutro tunnel.

The Chinesc Amhassador has arrived at Madrid, Spain.

Indian Jack has been executed for murder in Shasta.

Virginia, Nev., had two shocks of earthquake on the 27th.

Vacaville peach orchards ars affected hy curled leaf.

The steamer *El Capitan* has heen repaircd and launched again.

Numerous foreign failures, with heavy liahilities, arc rcported.

There is a deficit of 80,000,000 francs in the Spanish hudgct.

Russia will soon add a number of swift cruissrs to her flest.

The police at St. Petersburg have been reinforced hy 150 soldiers.

The loss hy the reccnt fire at The Dalles, Or., is now stated at $200,000.

Hill, Supervising Architect of the Treasury, bas heeu rcstored to duty.

Herr Seydewitz has hsen elected President of the German Reichstag.

Germany and France are co-opsrating heartily on the Greek qucstion.

The bay crop ncar Elko, Nev., is liable to fail through want of rain.

The House passed the Warner silvsr bill Saturday hy 17 majority.

Over 6,000,000 feet of logs are now hanked on the shores of Lake Tahoe.

The Pasadcna, Los Angeles, schools havs closed on accouut of scarlet fever.

The steamer *Alaska* has heen ordered to return to San Francisco from Sitka.

The restoration of a state of siege in the Basque Provinces has heen postponed.

Judge Edwin Marsh, of Olympia, W. T., was rccently drowned in Puget sound.

Colin M. Boyd succeeds the late George F. Maynard as Auditor of San Francisco.

Incendiaries have hurned 186 houses in a village in the government of Ufa, Russia.

A fishing schooner has hsen lost on the Massachusetts coast, with a crew of 12 men.

A portion of the crsw for the *Jeannette* Arctic expedition are on their way to California.

A heavy seizure of logs has been mads hy Government officials in Washington Territory.

John A. Moore, of school questions notoriety in San Francisco, is teaching school in Texas.

The propagation of California trout iu the streams of New York is proving a great success.

Five vessels have arrived at Portland, Or., from Hougkong, bringing 2,000 Chinese passengers.

The King of Spain has signed a decree re-establishing a state of siege in the Basque Provinces.

President C. B. Wright, of the Northern Pacific Railroad Company, is ahout to rcsign his position.

Frankenstein, an Ultramontane, has heen electcd First Vice-Presidsnt of the German Reichstag.

The Southern California Horticultural Society offer premiums for brass hand music at their next fair.

The river Danuhe is flooding the country through which it runs, and the high watsr is doing great damage.

The negotiations for the transfer of the administration of the Eastern Roumelia to Governor Aleka Pasha have heen satisfactorily concluded.

The Shoewaecaemettes are barred from participating in the Henley (Eng.) regatta, on accouut of their having been mechanics or artisans.

Important Real Estate Transfer.

J. J. Bell, of Bell's toll bridge and ranch on Clear creek, on the Reading grant, four miles soutb of Rsading, Shasta county, bas sold out to Maj. W. W. McCoy, of Eureka, Nevada. The sale includes a large number of Angora and graded goats, some valuahle horses and other live stock. The land purchased amounts to several hundred acres. The house is pleasantly situated on the hank of the never-failing Clear creek, adjacent to lsvel meadow land on one side and modsrately sloping wooded pasturs land on ths other side. Ws understand that Maj. McCoy intends making additional buildings and improvements on the placs at once. Being close to ths railroad section house at the junction of roads from different directions, Bell's ranch now promises to he the nuclsus of an important place for the future, when the surrounding lands ars mors fully settled up and thoroughly cultivated. Accommodations will he offered the present season for a number of summer hoarders, who will no douht find a combination of advantages in favor of this location for abiding the year around. Maj. McCoy and family are wall known as old residents of San Joss, and many friends will bespeak for them a good wslcoms in their new location. Mr. Bell established his home at the crossing some 20 years ago, and is well known to the traveling public in ths northsrn couuties of California and of southsrn Oregon. He intends engaging in some active husiness in Reading or vicinity in dus time.

Every new subscriber who doss not receive the paper and every old subscriher not credited on tbe lahel witbin two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is uscessary to protect us and subscrihers against the acts and mistakes of others.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Orubsr's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

How to Stop this Paper.—It is not a horculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Settlers aud others wishing good farming lands for surs crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisemsnt appears from time to time in this paper.

Miss Beatrice Strafford will give a popular dramatic and musical entertainment at Dashaway Hall, San Francisco, May 31st.

Experimental Machinery, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. Fuller, 415 Market St., second floor, S. F.

Mining and Other Companies.

Persons interested in incorporated eharee will do well to recommend the publication of the official noticee of their companiee in this paper, as the cheapest appropriate medium for the eame.

Gover Mining and Milling Company.—Location of principal place of husiness, San Francisco, California. Location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Trustees, held on Wednesday, the twenty-first day of May, 1879, an assessment (No. 39) of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary at the office of the Company, Room 8, No. 402 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the first day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eleventh day of August, 1879, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of the Board of Trustees. W. O. WILSON, Secretary.

Office, Room 8, No. 402 Front street, San Francisco, Cal.

Address JOHN A. WORLEY, Cleveland, O

TO PACIFIC COAST INVENTORS.

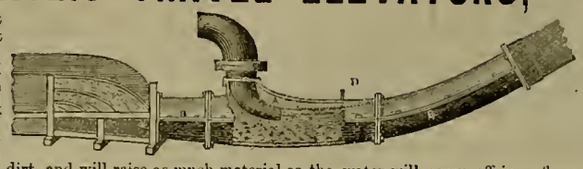
Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.



Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

STEEL CASTINGS.

From 1-4 to 10,000 lbs. Weight.

True to pattern, sound and solid, of unequaled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc. 12,000 Crank Shafts of this Steel now running proved superior to wrought iron. CRANK SHAFTS, CROSSHEADS and GEARING, specialties. Circulars and Price Lists free. Address

Chester Steel Castings Co.

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Worke, are the only partiee authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the Licenee of thie Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, Preeident.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradise Valley, Jefferson, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Plomoses.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned as they will be vigorously prosecuted and involved in heavy damages.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - - San Francisco, Cal.

Trall Hygienic, Medical and Surgical Sanitarium.

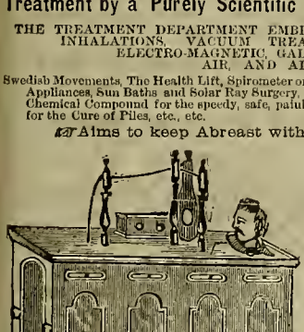
No. 8 Ellis Street, San Francisco, Cal.

Treatment by a Purely Scientific and Rational Method Without Drugs of any Kind.

THE TREATMENT DEPARTMENT EMBRACES ALL APPROVED REMEDIAL AGENTS, AS OXYGEN INHALATIONS, VACUUM TREATMENT, THERMO-ELECTRIC, TURCO-AMERICAN, ELECTRO-MAGNETIC, GALVANO-CHEMICAL, STEAM, VAPOR, WARM AIR, AND ALL FORMS OF WATER BATHS;

Swedish Movements, The Health Lift, Spirometer or Lung Strengthener, Steam Atomizers, all Electric, Galvanic and Surgical Appliances, Sun Baths and Solar Ray Surgery, new and perfect Truss for the Radical Cure of Hernia, lately discovered Chemical Compound for the speedy, safe, painless and permanent removal of Cancers, Scientific and successful method for the Cure of Piles, etc., etc.

☞Aims to keep Abreast with, if not in advance of the Progressive Age.☜



It has been the mission of this System to mold public sentiment, and this Institution will hope to be no disgrace to the immortal name it has assumed. The time has come when Physicians of this School can afford financially to keep a conscience; in fact it is disastrous financially as well as morally to compromise the truth one iota; hence patients can rest assured that they will be treated by the Physicians after the most approved and scientific methods, out of pure and enlightened selfishness, recognizing the truth and beauty of this great principle:

"*The Universe is so ordered and arranged that the real and permanent good of every creature is best subserved in promoting the real and permanent good of every other being.*"

THE BOARDING DEPARTMENT.

The table will be supplied with the best the excelsior market of the world affords, embracing fruits, grains, vegetables, meats, fish, fowl, eggs, cream, etc. Regular and transient boarders will be accommodated as well as patients. Business and professional men and women who are tired of restaurant fare, may appreciate eating to live a more healthful and enjoyable life. Pure food means pure blood. Pure blood means good health.

"The vegetarian school has demonstrated beyond the possibility of a doubt that farinaceous dishes, sweet milk and fruit, are sufficient to maintain a *hard working* man in perfect health. Such a diet might certainly be substituted by sedentary people for their greasy steaks and ragouts.—*Popular Science Monthly, December, 1878.*

The Rooms are pleasant, warm, well ventilated and sunny; convenient to treatment rooms, so as to afford the best advantage of nursing and professional attendance.

GENERAL PRACTICE.

Fevers, and in fact all cases may be treated at home successfully. Parturition confinement cases are taken in the Institution or attended at home in any part of the city or country. Preparatory treatment in these cases is most important.

Testimonials of extraordinary cases and cures can be seen on application. The most desperate cases, and especially those that have been given up as incurable by the old methods, are invited. Puerperal and typhoid fever and diphtheria cases, after all other methods have failed, may be said to be a specialty. ☞Send for the TRALL HEALTH JOURNAL.

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS, President.

Fuse Lighter and Fuse.

COL. SAM'L O. GREGORY, Secretary.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

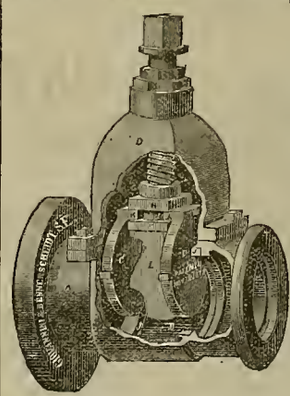
The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G., & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

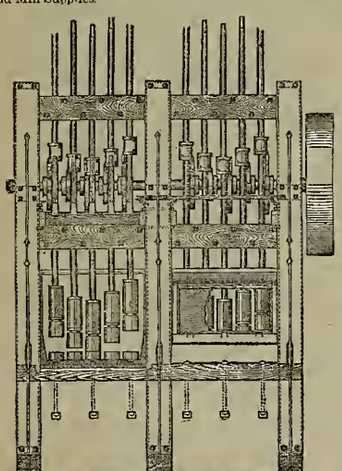
Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.

We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JUNE 7, 1879.

VOLUME XXXVIII Number 23.

The Discovery of Gold in India.

It appears, from ths London *Mining Journal*, tbat rich gold deposits bavs recently been discovered in the district of South Wynaad, India. These deposits are spread over an arsa of 25 miles by 13, and no less than 90 outcrops of ore reefs, with a thickness of two to four fset, havs already been located. Ths ore yields from a fsw pennywsights to 200 ounces of gold per ton. These veins are declarsd to bs very similar to some of thosa most successfully worked in Victoria, Australia—abundance of visibls gold, and ths qnartz stained with iron in jnst ths sams way. Other specimens show the gold iu a nicely dscomposed matrix, whils othsrs consist of rich auriferous gravels. It appears that the district has bsen hitherto regardsd almost sxclusively as a coffee-producing district, and that Messrs. Smith, Fleming & Co. have besn actively eugaged in connection with the matter for the last two or thres years, but have delayed investigation in consequence of ths tedious nsgotiations for securing planters' rights. At the present time, however, they have every facility for sxtsnsive and profitable operations.

A few months ago this district was inspected, on behalf of Messrs. Smith, Fleming & Co., by Mr. Oliver Peglsr, A. R. S. M., the substance of whose report we quote in this article. Mr. Pegler's rsport is nscessarily crude and preliminary, owing to the difficnlties of making a careful and thorough inspection, being obliged to resort to a ruse to visit some of ths ledges, and elude the vigilaucs of the natives. Enough, bowsver, is known to sbow beyond douht that ths district is capabls of yielding enormous wealth.

The range of mountains on which the Wynaad district is situated is of vsry ancient dats, belonging to the palaeozoic psriod, more especially to that of the silurian formations. The highest peaks of the rangs ars formed of hard, dense, dark crystalline rocks of ths mstamorpbic series of granites, etc. The softer varieties of rocks ars prssent and form ths vallsys adjacent to tbe psaks. Thsse lattsr are of a ligbtsr color, and give a red and brown appearancs to the country. Ths average altitude ranges from 7,400 to 8,400 fest. The whole of the formations are impregnatsd with black magnetic oxide of iron, which, aftsr a shower of rain, appears as black sand on snrfaces wbere watsr has run over in streams. The whole of ths country is ramified witb a rnn of bold quartz vsins, which are true ledges. Ths general run of thess ledges is parallel, the direction of the strike bsing almost invariably north and south. These ledges, which are met with in every part of the country, are often of great breadth, 15, 20, and 30 feet in thickness, and are composed of white crystalline compact quartz, identioal in every respect with the vein qnartz of Russia, Australia, California and Nevada.

The quartz is of varied character, changing from the compact, sub-crystalline, milk-white stone to a decomposed granite more or less fernginons. The large outcrops are of the former, but as the depth is increased the quality changee into a decomposed ferruginous stone. The Bear ledge is an instance of the latter, while the Monarch ledge traced for nine miles shows a bold, dense lode, with an outcrop of true chloride or greenstone running very near it. From the appearance of the quartz ledges it is plain that the dense, compact, heavy lodes bave resisted denudation, and thus the high ridges and hill-tops are formed, while the softer portions of the ledge have been eroded away. The native minere avoided these adamantine ledges, and confined their working to the softer and more yielding ledges on lower elevations.

There can be no douht thac a great portion of the gold is closely combined with and held imprisoned by iron pyrites, which is undoubtedly auriferous in nature, and mucb resembles the auriferous pyrites of the Nevada mines. The ancient native minere well knew this, and calcined all the stone before attempting to separate the sought-for-gold, and to this day the intelligent Korumbars, wbo still mine and scarch for gold, calcine before crushing, washing and amalgamating tbe residual fine gold.

Operations are only carried on by native washsrs in the recent surfacs earth, which spreads over the whole country, and in the present river beds and bars. But little is known of rccent deep alluvial deposits, which occur as large exteuding flats, and are now swamps ntilized for cultivating rice and paddy. At or near Dsvalah in this district, Mr. Pegler discovered evidences of extensive old workings on ons of thsse flats, numsrous pits or sbafts having been sunk, probably to ths lowsr whits clay or mother rock, and the lower stratum of recent earth, debris or clay, would contain ths gold.

Satisfactory proofs have been arrived at of the presence of ancient deposits in the Wynaad, a Mr. King having made a clossr inspection. At

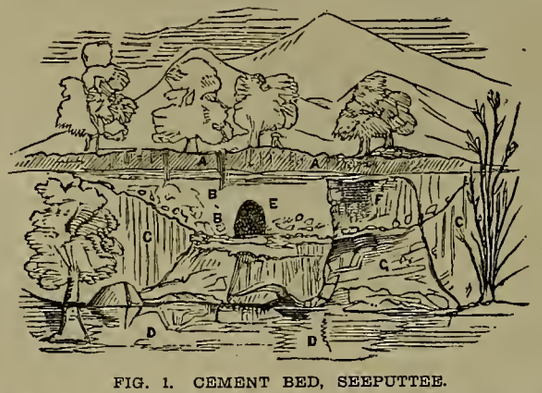

FIG. 1. CEMENT BED, SEEPUTTEE.

Seepnttee, ths present river of that name has cut through an ancieut aud trus cemeut deposit. The ancient bed exists as a mixture of rolled pebbles, mostly quartz stone, etc., cemented with the sand and also white clayey and silicious ssams into a hard dsnse conglomerate. The natives had anciently mads some attempts at working the bed, and had evidently removed soms four tons of the material, but the small amount of gold present discouraged further work. Thers can bs no doubt that the lowest strata of this deposit might bs worked to a profit, as there is sufficient water adjacent for almost any purposs.

The bed rests on the mothsr rock, which is

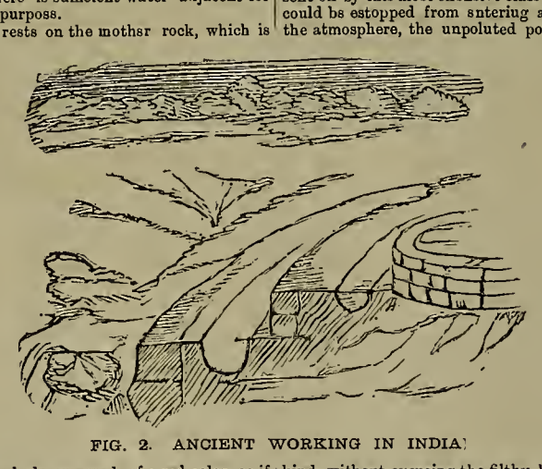

FIG. 2. ANCIENT WORKING IN INDIA.

very soft and decomposed, of a red color, as if of a granite or gneissic nature. The present stream cuts it almost at right angles, and there can be no douht that the old bed represents a true auriferous cement deposit, and was deposited by a very different system of river coursee and flow to those existing at the present day. It has been pierced to some 20 or 30 feet by a drift, which was full of water when discovered, hut which did not prevent inspcction.

We give a faithful representation of the alluvial cement bed at Seeputtee, as it appears on the river side.

A, *A*, surface soil, from 5 to 10 feet; *B*, cement bed, or ancient river bed; *C*, decomposed vertical rock; *D*, present river Seeputtee; *E*, old working; *F*, short drift, recent; *G*, excavation in soft rock under old cement beds; *B*, lowest layer, very large pebbles, much rounded.

Thsre is no room for conjecturs in regard to the ancient working of these deposits, in fact the accidental circumstances which brought them to light wsre msrely a rediscovery. We reserve for anothsr article an examination into thess ancient workings. Ws subjoin, howsver, a cut showing remains of old work in the shape of retraced sluicings, the face of each stage being hnilt up with country stone, granits, or similar material.

WANTED, A SUPPLEMENTARY "SMOKE-CONSUMER."—Among the recent triumphs of mechanical genius is the "smoke-consuming engine." What of annoyancs from smoke, soot and flying cinders is through this devics avoided, mucb-traveled people by rail can attest. Would now soms inventor ariss equal to ths occasion, and through tbe contrivance of a "smoks-consuming tobacco sucker," relieve tbe world of that first-class abomination, hs wonld entitle himself to the thanks of the sslf-respecting and cleanly for all tims to coms. If only the fumes sent off by this most offsnsive class of "suckers" could bs estopped from snteriug and poisoning the atmosphere, the unpoluted portion of mankind, without excusing the filthy habit of these people, might feel constrained to endure the etench emitted by their persons in sadness and silence. We await the advent of this gifted inventor.

OUR AGENT IN NEVADA.—Mr. S. V. Blakeslee, traveling agent and correspondent for the PRESS, is now on his way through Nevada in the interest of our publications. He will represent us in business transactions and will keep our readers informed of the latest phases of industrial progress which come under his observation. We bospeak him a kind reception among our friends in the Silver State.

IT is thought that Germany will return to the bi-metallic policy.

A Breezy Time and a Booming Market.

Ths *Evening Post*, of sound jndgmsnt gensrally on mining matters, avers that this is going to be a grand year for mining excitements, especially on the Comstock rangs. And this excitemsnt is not going to bs a tams affair either, nor yet local in its effects—it is to bs wide-spread and a vsry whirlwind, swseping the country from the Atlantic to the Pacific. And in this we suspect our contemporary is right. Ws gusss things ars going to bs a little breezy in the stock world bsfors long. And why not! Are not our finances in a bsalthful condition and ths country in a prosperous way? Though not sxactly flourishing our industries ars improving, and there is not hy one per cent. as much misery in ths land as there was a year or two ago.

Through soms slightly restricted expenditure and the practics of a little more economy our psople havs so traveled up out of the valley of tribulation and suffering that thsy can percsivs on the far off horizon a faint gleam of hsttsr times. Of courss they can, and hsing a sensible people and grateful withal, shall they not now show their appreciation of such slight amendment in their material affairs by indulging in a littls stock spcculation? Now that they can afford it, shall they not hazard a littls monsy in the mining sharc markst which promises soon such animation and profit? We should say thsy might, and advise all wbo require furthsr lessons in this school to coms right up and take them now. If their system needs this sort of medicins it is as well to take it and gst cursd at once.

To a person of this kind we would say, if you have not the money in bank or just where you can lay your band upon it, why, pawn your watcb, spout your jewelry, mortgage yonr homestead or hypothecate your wages and raiso it. This, in tbe first instance; it will hs time snough to abstract the publio fnuds committed to your care, misapply fiduciary trusts and steal from your employer after thess privats resources have been exhausted. But in no event should you neglect the opportunity afforded to make money hy this promised booming of the stock market. To all who have not yet had enough to do with this wretched business of stock gamhling ws would say, jump in and at the approaching upheaval havs dons with it. Don't be scrupulous, don't delay; discount the good tims coming and make hasts to be rich. Catch ths scent and follow the trail of fleeting fortuns though it lead through insanity and suicide down to ths chambers of final psrdition. Go in, you may not live to ses another booming market, aud even though you loose your money you may yet enjoy yourssIf, for, as Hudibras puts it,

> "Soms think ths pleasure is as great
> In being cbsated as to cheat,"

As remarked at the outset, we should not be surprised to see greater animation in mining shares before long. A movement looking to that end is in progress. The machine is bsing charged and after a few more turns of the crank will begin to sparkle and splutter, preparatory to throwing off those brilliant corruscations that so electrify the stock market. If when it gets well at work a good many sball be struck with metaphorical lightning it will be in accordance with past experience and the purpose for whicb the thing was gotten up.

METEOROLOGICAL SUMMARY FOR MAY.—The report of the United States Signal Service officer of San Francisco, for the month of May is summarized as follows: The mean hight of barometer for the month was 30.10; mean temperature, 55.9; mean humidity, 70.7; prevailing winds, west; highest barometer, 30.29; lowest, 29.92; highest temperature, 75°; lowest 45°; monthly range, 26.5°; greatest velocity of wind, 30 miles per hour; total number of miles trayeled hy wind, 7,923; total rainfall, 2.33 inches. Rainfall in May during former years: 1872, .18 inches; 1873, 3.00 inches; 1874, .66 inches; 1875, .22 inches; 1876, .24 inches; 1877, .18 inches; 1878, .16 inches.

THE Senate has passed the bill making subsidiary silver coins interchangeable with greenbacks or standard silver dollars.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Working Base Ores in Utah.

EDITORS PRESS:—Believing that au article on the subject of amalgamating hass metal ores will he of interest to your readers, I send you the following account of the successful working of hase metal tailings at the Marsae mill, in this place, by H. S. Jacohs, a professional amalgamator and expert of long practical expsrience. I will treat the subject as fully as it may he done, without trenching upon professional secrets, for, like other skilled labor, this handling of ores becomes a complicated art proportionately with ths increase of the bese metals, and the difficulty of separating the precious metals therefrom without great loss of quicksilver.

In order to do this euccessfully the amalgamator must possess a considerable knowledge of metallurgy and also of chemietry, in so far as it relates to the dissolving power of chemicale upon sulphurets, pellurets, antimony, arsenic, etc.; and tends to keep the quicksilver in perfect form eo that amalgamation may take place before new combinations, are formed of tbe freed metale.

Only a few years ago it was considered impracticable, if not impossible, to beneficiate oree containing more than from 5% to 10% lead, or half that quantity of antimony, arsenic or zinc, by amalgamation. But this clase of ores after roasting in the Stetefeldt furnace can be successfully treated, as the working of the Ontario ores at this place fully establishes. This is the worst ore I have ever seen treated by amalgamation. Although very rich, it is full of the base metals mentioned, the most of the lower levels containing a much larger percentage of these than cited above, and without this furnace could not be worked to a profit. The ores taken from the surface and upper levels of the Ontario were, when the mill was huilt, comparatively free milling. Had the ores on top heen as base as at present, the company would probably have tried smelting from the start. It is well for the owners of this class of mines that circumstances have compelled this company to show what may be done by skill and enterprise.

It is impossible from the surface ores of this Territory, to predict what may be the nature of those only a few hundred feet below. Free milling ore on the surface may change to rich galena, or rich galena to chlorides as we go down, eo that the kind of reduction worke required is a problem to he solved only by deep exploration. Despite the moet skillful treatment a certain percentage passes off with the first working, to be again treated in the form of tailings, after they have passed through a process of decomposition and oxidation, so far ae the nature of the metale and minerals will admit of the same. In California it is well known that the sulphurets from gold-bearing rock, extracted from below the water levels, known ae "raw eulphurets," cannot be euccessfully treated by the ordinary pan process without the aid of powerful decomposing chemicals, though this can be worked to 85% or 90% after lying exposed to the atmosphere until the iron is thoroughly oxidized. Thie result, however, is not obtained with the Ontario tailings. Antimony, zinc, gray copper and arsenic, if they are subject to decomposition at all, decompose in so slow and imperceptihle a manner that human patience would be exhausted waiting the natural action of the elements in this direction. How then can they be treated?

Before answering this question it is necessary to state that the Marsae mill is owned and was built by a company of Michigan men who believed they had a mine of milling ore in the Flagstaff, a belief that bas not yet been verified. The Ontario company, before building a mill of their own, leased and ran the Marsae; it is the working of these tailings, and also tailings from the Ontario mill, some of them roasted and some raw, of which we propose to speak. These tailings, having heen often examined by practical men, were sent to San Francisco, and there tried and condemned as refractory and unworkable to a profit, although they contained, as tested by fire assays, an average of $30 per ton.

After the Ontario company had completed their own reduction works and ceased to operate the Marsae mill, it remained idle for a time, until Mr. Edward P. Ferry, a brother of the Senator from Michigan, took hold of the property, with a view of testing, practically, the mooted question whether these rebellious remains could he worked to a profit. He was fortunate enough to eecure the eervices of Mr. H. S. Jacohs, a practical and scientific metallurgist and amalgamator, who now confesses that he was at first deceived by imperfect preliminary assays, which showed only the silver contained, without the base elements to be contended with, declaring that he would not have undertaken the task if a proper analysie had been given him. Having entered upon the task he determined to pereevere, and is now working these ores with a profit of near $200 per day over expenses, though old mill men predicted entire failure or great lose of quicksilver. The tailings here contained so much pay, and the Marsae company had expended so much money in the building and outfitting the mill, etc., that they were loth to discard it altogethsr. They tried concentration and found the material would pay, hut much of the best of it was wasted. Yet they could not consent to have the mill lying dead property, with 20,000 tons of tailings before it that should he worked and which are now giving employment to 100 people. All was done by the employees of the Ontario company, in the first working of the ore, that they could possihly accomplish. Ths escaping silver is wrepped up in combination with antimony, zinc and gray copper, which can only he attacked hy powerful chemical action of a kind which would he inoperativs in the whole mass of ore. To effect a more perfect amalgamation, the whole of the metals must he changed to chlorides. The loss that still goes off with the tailings is that portion of the hase metals that contain silver, which will not chloridize. One of the worst, if not the very worst metal in this ore, is the gray copper mentioned. It contains antimony, sulphur, iron, arsenic and copper, with silver. It is believed that this is the richest base, and that a large percentage of the silver goes off in this combination which cannot be decomposed by such an amonnt of chemicals as it would be profitable to employ for that purpose, working the stuff in quantity. It ie needless to eay to those having a knowledge of amalgamation, that all of the base metals enumerated have a sickening effect upon the qnicksilver that must be constantly worked againet. The treatment that will keep it in good form a few days cannot be continued *ad infinitum*. For instance, in the early employment of sodium amalgam, it was soon found that by constant use it lost the desired effect, wherefore some other chemical had to be employed to attack the disease. It was formerly helieved that frequent retorting would cleanse the quicksilver. This, however, ie only a temporary expedient; the sensitive metal must have its stimulants. One of the finest improvements made by Mr. Jacobs, and which will be appreciated by old amalgamatore, is the employment of a syphon in the settlere to constantly draw the water from the enrface. The nozzle being only an inch helow the surface draws off the contents, without taking quicksilver or drawing the plugs, which are distant from each other about ten inches. The loss of quicksilver, in working by this plan these difficult materials, ie less than half a pound per ton, ehowing that the portion that cannot he saved is not lost in this way. Thc allowable lose of quicksilver in working Comstock ores was formerly three pounds per ton. How much that has heen reduced of late years, I am not prepared to say, but the actual loss in moet mills far exceeds a half pound with ordinary oree. "'49ER."

Park City, Utah, May 20th, 1879.

Letter from the Comstock.

EDITORS PRESS:—The principal work going on at the mines in tbis vicinity is preparatory to the development and extraction of ore. The Alta and Benton bave, for a long time, been engaged in einking to different levels, opening stations and extending drifts along the lode preparatory to crosscutting at various points. When thie is commenced, owing to the condition the minee are in, ore extraction, wheu begun, can be continued to much advantage, but little dead work being thereafter needed. These mines shonld be enabled to continue the outpnt of ore constantly for a long time, that ie if ore bodiee exiet in them—a fact which ought to be pretty well established hy this time. They have the same lode as tbe Justice. The matrix of the metals is principally gypsum, the same ae in the Juetice and Occidental mines. If the Forman shaft is continued to a certain depth it will no doubt strike tbe same lode, which, of course, is entirely independent of the one on which the Overman and Caledonia were originally located. The Forman ehaft is now being sunk by the Crown Point, Belcher, Segregated Belcher, Overman and Caledonia companies, and will he the one through which these mines will be eventually worked. It is eome distance east of the new Yellow Jacket ehaft. Besides the Yellow Jacket mine heing worked through their new shaft, the Imperial Con., Bulbon, Alpha, Exchequer, Confidence, and the other small mines in that vicinity, will also do their work through that shaft, which ie now the deepest perpendicular shaft in the State, being over 2,500 feet in depth. The greateet sloping depth attained by any mine here ie that of the Belcher incline, which is now about 2,700 feet, and is to be continued on to a depth of 3,000 feet. With all the labor and expenditure of money it ie to be hoped that the stockholders will be rewarded through the development of a hig bonanza. If having attained a depth of 3,000 feet, and the ground at that depth has been explored in different directions, a body of rich ore is not found, then it may be considered to he an abandoned mine. As for continuing the working to any greater depth, that would be almost impossihle, and if any deposit was found it would have to be almost pure silver to make its extraction profitable, as the heat of the water and air would be almost intolerable. It is possihle, at great expense, to cool the air, but not the water. The Chollar, Potosi, Hale & Norcrose and Savage are doing nothing more than keeping matters and things about the mines in order; waiting for the Sutro drain tunnel to hs completed, when these compenies propose to reveal to the world the bonanzas that they would have us helieve are huried there. They are now in a condition to dispose of their surplus water cheaply. This place depends on their success largely. The Gould & Curry and Best & Belcher are also idle, except keeping things in shape; waiting for the sinking of the Osbiston shaft. The most that they ars doing is the running of a drift, jointly, east to connect with that shaft when in reaches the 1700-foot level. The sub-drain in the Sutro tunnel will not he completed hefore the 1st of July, when the work of enlarging the tunnel, where it is not of the requisite size, will be commenced, and which will take much time and money to complete. The work on the lateral tunnels, north and south, can, and probably will, he carried on at the same time. The yield of ore from the Con. Virginia and California has been much less this month than for April, which makes it look as though no May dividends would be paid. Tbe Ophir is taking out about 70 tons of ore daily, and there is some prospect that the amount may he increased, yet this is not absolutely certain, although a short time ago the puhlic was given to understand that the output of ore would steadily increase.

J. D.

Virginia City, Nev., May 30tb, 1879.

The Horn Silver Mine.

Mr. W. A. Hooker, Mining Engineer, eends the Salt Lake *Tribune* the following report of Utah's bonanza, the Horn Silver mine: This immense hody of ore, reported to he the greatest yet diecovered on the continent, lios in the San Francisco mining district, Beaver county, 225 miles eouthwest from Salt Lake. It was diecovered September 24th, 1875, by James Ryan and Samuel Hawkes, who sunk a shaft ahout 30 feet on the ore, when they sold their claim the February following, to Messrs. A. G. Campbell, Matthew Cullen, Dennis Ryan and A. Byram. The purchasers immediately eet ahout developing the property, their labor resulting in proviug the vein to a depth of over 280 feet, and extracting 25,000 tons of ore which has been turned into bullion.

Almost the first work done in the mine was the driving of a short tunnel towarde the footwall, at a point 150 feet eoutherly from the original ehaft, and within this tunnel a winze was commenced. Subsequently the ground above was removed from the entrance to make room for the working shaft. The ore is here partly covered with a cap-rock of quartzite; but in blasting down this material, and leveling off the surface, ore was discovered for a distance of 50 feet. The report gives minute details of the work doue in the mine, of which the following is the summary: The principal working shaft is near the center of the claim, at tbe discovery. It extends vertically 113 feet to the hottom of the third level. The first level is distant 46 feet from tbe mouth of the shaft. Twenty-eight feet below, or 74 fcet from the surface ie the second level; and 40 feet helow this again, or 113 feet from the eurface, is the third level. The fourth level, 91 feet below the third, is connected with it by three winzes. The fifth level is 50 feet helow the fourth, or 255 feet from the month of the working shaft. The old ehaft lies 145 feet north of the working ehaft. It was continued down to the line of the second level, and connected with it by a drift.

The ore thus far removed has been taken from between the firet and third levels; the lower levele having been driven merely to explore the vein. The first level is entirely in ore, no indications of a wall being observable. Betwecn the first and secoud levels are three floors, and still no indication of a wall is seen; the timbers being eurrounded on all sides with ore. The total length of the second level, measured in a straight line, is 295 feet. Between the second and third levels there are five floors, all of which are eurrounded with ore. The old shaft was sunk its entire depth in ore.

The length of the third level in a straight line is 300 feet. The southern end consiste of a drift 56 feet long. Near its beginning, on the west side, is what appears to be footwall clay, and a similar material appears at the further end, which is thought to mark the approach to the hanging wall. This level is connected with the fonrth by three winzes. No. 2 is the only one in use, and the only one accessihle. It is 91 feet in depth, etriking footwall clay ncar thc bottom, and ehows pure ore its entire length. In the fourth level a different character of ore is reached, which lcaches readily and carries a fair amount of silver. About 100 tons has been taken from this level, which was treated euccessfully in the leaching worke in Frieco. The main drift on this level has been driven on the boundary line between the smelting and the leaching ores. The timbers in the eouthwestern end of this level rest directly on the eolid footwall. The wall rock is concealed below the timhering, bnt ferruginous clay overlies it. This affords a hasis for measuring the exact width of the vein, one of the few places in the mine where a measurement can he made. Here its horizontal width is 45 feet. The fifth level consists of a single drift, which discloses excellent smelting ore; near the bottom of the winze it merges into footwall clay.

The milling ores constitute the richest portions of the deposit, carrying from 75 to 200 ounces of silver to the ton, while smaller samples run into the thousande. The smelting ores comprise the greater portion of the ors mass, heing soft and earthy, consisting esssntially of sulphate of lead, with some plumhic ocher and carhonate of lead, all carrying silver. The lead ranges from 30% to 60%, and the silver from 30 to 75 ounces. The leeching ore, as mentioned above, occurs in the fourth and fifth levels; it differs from the other ores in appearance, and is white, red and yellow. A partial analysis of this ore showed 86 ounces of silver to the ton. Ths average of 1,271 tons reduced by the Frisco Smelting Company, up to March 1st, 1878, was 44½% of silver and 41% of lced, and the average of 5,612 tons reduced hy the sams company from March, 1878, to February 1st, 1879, gave suhstantially the same results. In estimating the amount of ore exposed in the present workings, Mr. Hooker, after a careful measurement, and allowing for wastage, horses, etc. (figuring 10 cuhic feet to the ton), finds 513,000 tons of ore in sight in the mine.

The quantity of ore extracted up to February 1st last is given at 22,712 tons. During Febraery about 90 tons daily was taken out, making a total of 25,000 tons. The cost of taking out this amount of ore a day is figured at $3.05 per ton. The cost of smelting one ton of ore is stated at $18.54, bnt this cau be materially reduced by extending the facilitiee and on the completion of the railroad to Frisco. One ton of base bullion is derived from 2⅜ tons of ore. The cost of producing this ton of base bullion, including everything (freight to Chicago and expense of refining added in) is $108.09. The product ie as follows:

92.50% lead at $70	$ 64.75
107.7 ozs. silver at $1.10	111.87
Total	$176.62
Balance, profit on 2⅜ tons of ore	68.53
Or profit per ton of ore	$25.86

Mr. Hooker concludes his report as follows: While it would seem to be impossible to exaggerate the wealth of this property, the estimatee made in this report are believed to be rather under than above what may be reasonably anticipated upon a purely financial basis, and certainly with such favorable circumstances on all sides—au unlimited supply of ore of excellent quality, good and cheap fuel and fluxes, direct communication with market, and, it is to be hoped, judicious management, the conditione of a most successful enterprise appear to he satisfied.

The property now having passed into the hands of a company abundantly able to extend its facilitiee and inorease its output, and the completion of the railroad to Frisco heing a matter of ehort time, the cost of mining and reducing the ore will be considerably reduced, and the margin of profit correspondingly increased. This report confirms all that has hitherto heen said of Utah's great bonanza.

Re-locating Mining Claims.

For the information of parties making inquiry in regard to the law governing the re-location of mining claims, we here pubbsh the same, which is ae follows: "The re-location of abandoned lode claims shall he by sinking a new discovery shaft and fixiug new boundaries, in the same manner as if it were the location of a new claim; or the re-locator may sink the original discovery shaft 10 feet deeper than it was at the time of abandonmeut aud erect new or adopt the old boundaries, renewing the posts if removed or destroyed. In either case a new location stake shall be erected. In any case, whether the whole or part of any abandoned claim ie taken, the location certificate may state that the whole or any part of the new location is located as ahandoned property."

In this connection it may be well to state what has been judicially decided constitutes an abandonment of a claim, and which, as will be seen, rests in the intention. "An abandonment takee place when the ground is left by the locator, *without any intention of returning* or making any further use of it, independent of 'any mining rule or regulation.'" We are inclined to think, however, that where all legal requirements have been complied with, the intention to abandon would have to he proved in a very positive manner, and could not he established hy mere inference.

HISTORY OF THE YELLOW JACKET SHAFT.—There is kept at the Yellow Jacket new office a perfect history of the new shaft, and in euch a way that it can be reviewed at all times. It consists of specimens of the rock taken from every five feet of the shaft. These are kept in a convenient cabinet arranged for the purpose and fitted up with drawers and partitione in the drawers for keeping each epecimen of the rock by itself, distinctly labeled and ready to be referred to at a moment'e notice. This of itself ie very interesting, but the study of this history is greatly facilitated by another arrangement. A portion of each specimen is reduced to a pulp and spread to the thinness of paper on a slide, ready to be euhmitted to the microscope. The ingredients composing the rock are thus unmistakably set forth and in such a way that comparison can be made between any two portions of the shaft. These of themselves form an interesting study. The ends to be eubserved hy this collection are obvious.—*Gold Hill News.*

THE price of silver hae lately undergone a marked advance in both London and New York, the market being still strong with an npward tendency. The outlook for the producers of this metal ie encouraging.

MECHANICAL PROGRESS.

Molds and Cores for Casting Steel.

Steel made by tho open hearth furnace comes therefrom very much hotter than when melted by any other known process, Mr. George Cowing, of Cleveland, Ohio, has, therefore, been induced to invont an improved mode of casting. It is on accouut of this intense heat of the molten steel that difficulties heve arisen in castiag, as the coutact of tho steel with the walls of the mold fuses tho material of the mold and forms a flux or scoria that coats tbe casting and is difficult to remove. This effect takes place with all materials that havo been heretofore used for uiolds. Common sand, plumbago, charcoal, coke, and other matorials have beeu tried, but the foreigu mattere contaiued in these substances are of such a nature that the succcssful preventiou of flux or scoria has not been heretofore accomplished. Tho object of his invention is to coastruct a mold from a substance that is adapted for ordiuary uso as molding material and possessee refractory qualitiee sufficient to successfully resist the tendency to flux when brought in contact with the hottest molten steel. According to his invention, silica is used in the construction of molds for thie purpose, as it has been discovered that pure silica, with suitable binding material, answers the requirements set forth, and that by its use, steel castings may be produced almost or entirely free from the flux or scoria. Iu proportion as the silica used for molds contains limestone, feldspar, mica, or othsr silicates, oxide of iron, or foroign matters of any kind, the castings will bo coated ae described, and sand, such as is used for molds, contains silica more or less mingled with the substances named.

Tbis fect, without doubt, explains the reason why it has been heretofore considered impracticable to use sand molds or molds made from powdered stone, old clay pots, or like material for casting steel from an open beartb furnace. Ia oarrying out this invention it is preferred to obtain the silica from rock crystal, white pebbliss, or white sand; if white pebblee are used they ehould first be pulverized and thoroughly freed from oxide of iron or other foreign matters. When ahout to be formed into molds the silica is to be mixed with any appropriato binding material, such as molasses, sour beer, flour, or other glntinous substance, eilicate of alumina, or the like, care being taken to employ no subetance containing any metallic oxide, or anything that migbt flux. A sufficient qnantity of the binding material will be mixed with the pulverized silica to form a plastic mass that can be molded, and will retain its shape after molding. An additional advantage ohtained hy the application of this invention is the ability to cast mild steel—*i.* e., steel having a low percentage of carhon, which cannot he done in molds consisting of or containing plumbago, graphite, coke, or other forms of carbon without subsequent annealing. As etated bofore, he is aware that materials containing more or less silica have been used for molds, but in such materials the refractory qualities of silica which render it useful for the purpose are neutralized by the other materials.

Salt in the Manufacture of Finished Iron.

The question of the best method of applying salt in tbe puddling process has just been discussed by the managere of the mills and forges of South Staffordshire and East Worcestershire at a numerously attended meeting of their associations under the presidency of Mr. Price, manager of the Brettle Lane Iron Works, Stourbridge. Members stated they had thrown dry salt upon tbe bottom of the puddling furnace before the charge was put in, and upon the iron as it was about coming to the boil; that tbey had used it as a mixture with manganese, and as a mixture with firo-clay and red-ore. It had also been used in solution with water to saturate the bull-dog in the preparatiou of the fettling, and its use in soluticn adopted by Messrs. Nettleford was also epoken of. The quantity of salt used varied in nearly every case. As much as four pounds of dry salt had been thrown upon lean iron beginning to thicken, and the result was that the iron boiled fluid; when shingled, was hard like steel; when broken as a har, was highly crystalline; and after heing boiled, re-heated and drawn out tbrough the rolls, was very hrittle. Thrown upon the furnecs-bottom salt benefited the fettling. Used as a "physic" with manganese in iron for sheets it was found of advantage, since the bars were clear, and when rolled out the sheets bad a good surface. In getting up lean and soft iron for sheets it was found of especial advantage as a hardener. The mixture was deemed good for steel iron. Mr. Jeremiah Jones, manager of the Terry Hill works, bad with advantage used dry salt and manganese, in the proportion of two pounds of the former to three ounces of the latter, in the manufacture of iron for sheets. Melt mixed with fire-clay and red-ore and thrown in tbe bottom of the furnace had been found by Mr. William Farnworth, manager of Messrs. E. and W. Baldwin's worke, to harden the sheet-iron, and give the sheets a dry surface.

Mr. Farnworth bad also experieuced good results from throwing cold water on tbe iron wbile it was in tbe furnace. Ae to tbe application of salt and water upon the patented metbod of Mr. Barnett, Mr. Ellis, menager of tbs Primrose Hill Iron Works, said that he had tried it under Mr. Barnett's directions: One pound to one and one-half pounds of salt were dissolved in a quart of water, aad more water was afterwards added. This eolution was applied to a furnace for a fortnight with the result that it improved the fettling and the bottoms. The patentee's charge was, however, for his method of application, too expensive, and it was not continued. Mr. Cresswell, mill and forge manager at the Earl of Dudley's works, had employed tho solution on Mr. Barnett's principle for some months. He used ahout as much salt as had been used at the Primrose Hill Iron Works. It had been employed in a siuglo furnace and in a doublo gas furaace, and the rosults were the more satisfactory from the gas furnace. A comparisou of the yield of a gas furuace worked without tho solution and of ono worked with it showed a larger yield by one quarter and a few pounds from the latter. Tho bulldog was saturated with tho brius, about one gallon was poured on the double furnace bottom, and when tho chargs began to thicken about five quarts was put in on each side of tho doublo furnace. One furnace had been worked throughout a whole week, and no scrap ball had had to be used. Mr. Cresswell had known one fettling stand nine heats.

After hearing those and other similar experiences the meeting was of opinion that where hard steely irou was required the application of salt in eolution was beneficial, but where pliable and ductile iron was needed salt ehould not ho used. The information received was not, however, considered to be complete, and the further discussion of the subject was adjourned till after the annual trip of the association, which will be taken at the close of May, to the Castle Iron Works of Messrs. Nettlefold, in Shropshire, where the patented method ie working euccessfully.—*Wolverhampton (England) Chronicle.*

Casting Metals.

Hollow or ring-shaped ingots of steel or otber metal are ordinarily made by casting the metal in a mold, in the center of which is placed a core of some euitable material, by the removal of which after the ingot or casting has become solid the required ceutral hole is left. This plan of casting the metal rouud a core presents several inconveniences, one of the chief of which is that the casting, if it is thin, is often less sound or less solid than a block of metal would he of the same bulk, but cast without the central hole; moreover, special precautions must iu most cases be taken to avoid the risk of the metal cracking or tearing as it coutracts round the core in the act of cooling.

Witha view to overcome these inconveniences, Messrs. Taylor and Wailes, of Panteg, propose instead of making such ring-shaped ingots or castings in a mold in the center of which a core is fixed, hy the removal of which, after the metal has become solid, the required hole through the ingot or casting is left as above mentioned, they pour the metal into a mold, which is kept in rotation by preference round a vertical axis by mechanical means at sucb a high velocity that the liquid metal as soon as it is poured iuto the mold, is driven by the centrifugal force caused by the rotation of the mold against the inner circumference of the latter, so that as it cools, the metal becomes solidified in the form of a ring-shaped or hollow ingot or casting, the outer surface of whicb has the form of the mold, and the inner surface is more or lcss conical (or if the mold he rotated at a high velocity, the casting will be nearly cylindrical) forming, in fact, a ring-shaped section of tbe paraboloid of revolution which is the form taken by the free surface of a mass of beavy liquid in rapid rotation round a vertical axis. The axis of rotation, instead of being vertical, may, if fonnd more convenient, be inclined or even horizontal, provided that the velocity of rotation of the mold be sufficient to throw tho liquid metal (when poured into it) into the required annular form.

Improvements in Rolling Steel Rails.

The controversy which has arisen respecting the wisdom of a recent purchase of steel rails in England is taking a practical turn by directing the attention of manufacturers to certain improvements which, if adopted, promise to give to the American product an undoubted superiority, in point of durability, compared with any other. Mr. Wm. A. Jewett, a steel manufacturer of Syracuse, N. Y., says, after speaking of tbe manner in which Eaglish rails are rolled on two high trains:

If your train will stand it, roll your rail until the scale will set, and you will then make better rails than the English. That rails rolled as I direct will and do last longer than those made and finished hotter I am fully convinced, and I am equally sure that tbe reason therefor is the one I have given. I do not believe tbat the English railmakers understand this, and that they continue to use the two high train, and hold back the work for a purpose. I do not believe they know anything about it. * * * Were I a railroad manager, I would have all my rails rolled, for the last three passes in a chilled roll, with grooves polished, and let tbem he rolled so cold that the scale would set. Thus I should hring tbe steel to a condition adapted for tbe longest wear, the safest condition in which it can be left.

Wbatever the value of Mr. Jewett's suggestion, it is certain tbat manufacturere of steel rails in the United Statee will not permit the splendid business just opening to them to suffer loss on account of any superior process now be possession of thsir rivals, or what it may in possiblo for them to deviso.—*American Ship.*

HAY-BURNING COOK STOVES.—M. L. Wood, once a superintendent of ths U. I. & E. road, has inveuted a hay-burning cook stove, to consume the straw and grass of Western prairies. Six pounds of such material will burn 56 minutes and create heat equal to the consuming of 20 pounds of hard coal.

COTTON MANUFACTURE IN THE SOUTH.—It is stated that 183 cotton mills have been built in the South since tho war.

SCIENTIFIC PROGRESS.

A NEW AND IMPORTANT MINERAL.—About the 1st of December of last year, Dr. Henry Wurtz received a specimen of a nowly discovered mineral, said to occur in considerable quantities in Utah, where it ie found in veins of pipe clay. This mineral ie of a dark brown color, and waxy feel, and ie easily impressed by the finger nail. Dr. Wurtz made a preliminary examination, and found that it fuses at a little over 70 degrees C., and evidently consists of a number of homologuee of the paraffine series, such as those found in Europe, in Moldavia and Galicia. It is the first deposit of the kind known on this continent, and may prove of great value to that section of the country. Cold ether dissolves about 12% of a soft paraffine of greasy consistence aud having the color of hurnt sienna. It becomes transparent on melting and reeembles the urpethite of Johnston. Boiling ether dissolves about 37%, and leaves on evaporation a hard, waxy material, somewhat darker than the first portion. It is probably to be classed with ozocerite, notwithstanding its apparently greater hardness. The third portion, insoluble in ether, and comprising about 52% of the original mass, is very dark brown and decidedly harder than bseswax. It appears to approacb in character the Moldavian species of zietriskisite, hut its melting point is somewhat lower. Lack of sufficient material has hitherto prevented Dr. Wurtz from determining the varioue points of interest with satisfactory precision.

THE VELOCITY OF SOUND.—A memoir is published by William W. Jacques, in the February number of the *American Journal of Science and Arts*, on the velocity of very loud sounds. Tbe author gives an account of experiments, made at the United States Arsenal at Watertown, Mass., for the purpose of obtaining automatic measurements of the velocity of sound near a cannon. Behind the cannon—a six-pound brass field-piece—he placed at distances of 10, 30, 50, 90 and 100 feet from its mouth ingeniously-constructed membranes, having an electrical connection with a chrouograph capable of recording .00001 of a second. He found that the velocity of the sound was not greatest at the immediate rear of the cannon, but at eome distance from it, where it rose to a maximum "considerably above the ordinary velocity, and then fell gradually to ahout the velocity usually received." When the cannon was turned at right angles to the line of the series of membranes the distance of the maximum velocity of the sound came nearer the cannon. From these facts the antbor concludes that the velocity of sound is a function of its intensity, and that the experiments upon the velocity of sound in whicb a cannon is used contain an error, probably due to the bodily motion of the air near the cannon. The employment of a musical note of low intensity is, therefore, recommeaded to correctly determine the velocity of sound.

NOTE ON HÆMOCYANINE.—Hæmocyanine is the name given to a new substance obtained from tho blood of tbe devil fish, *Octopus vulgaris.* The liquid portion of tbe blood of tbis animal contains an albuminous liquid snbstance which forms, witb oxygen, a stahle compound of a dark blue color. In vacuo, by contact with living tissue, or when kept in closed vessels, dissociation and generation of oxygen ensue. This substance seems to perform the part of the bæmoglobin in tbe blood of warm-blooded animals. It is evaded with oxygen in the respiratory organs of the animal, carries it through the arterial system into the capillaries and tissues. The venous blood of tbe octopus is colorless, the arterial blood dark blue. These changes of color are tbe consequences of respiration. On laying open the main artery of tbe head, we find the blood circulating through the same to be blue as long as the animal breatbes under water. As soon as takeu out of the water the blood loses its color at once. Hæmocyanine may be easily obtained from the blood hy dialyzing the plasm formed by the blood for three or four days. Hereby the salts and otber diffusible euhstances are removed. Tbe remaining liquor is filtered and evaporated, whereby the hæmocyanine is obtained as a blue, gelatinous mass.—*Comptes Rendus.*

THE *Microscopical Journal* states tbat tbe Johns Hopkins University bas established a summer laboratory for the study of zoology. This laboratory is situated on the Chesapeake bay, and is nnder the charge of W. K. Brooks, wbo bas already shown tbe value of the laboratory in the stndy of marine fauna of that location.

ROCK DRILLING BY ELECTRICITY. — In a recently publisbed work of M. Gaston Plente, "Recherchee anr l'Electricite," noticed in one of our Freuch exchanges, the author mentions a new application of electricity which had not been hitherto published by him, aud which is of considerable interest. After describiug tho proces of engraving on glass by electricity, that hs mads known iu 1877, M. Plante goes on to say: "Ws have seen that one of the electrodes conductiug an electrical current of a certain tension being brought in coutact with glass, in the presence of a saline solution, it acts like a graver or diamond by tracing grooves in the surface of tho glass, and oven digs into it quite decply. In spits of its great hardness, rock crystal can also be attacked by tbe same method; and, if not engraved regularly, it at least cracks into small fragments, and is finally disintegrated." In view of this, M. Plante euggests that tho electric currcut, under coaditions analogous to those above described, might be eubstituted for diamouds in the operation of drilling rocks. Ho states that electrodes of platiuum would not be necessary, for here it is not the metal of the electrode that is affected, but the silicious matter in contact with a ealino solution. Metallic points or projections suitably located at tbe extremity of the drill, isolated on a part of its leagtb and actuated by a rotary movement, would lead the electric current to the surface of the rock to be pulverized, and would thus replace those numerous and expensive diamonds which are set in the head of the drills employed in the present system of rock boring.

SCIENTIFIC VIEWS OF NATURE.—Who does not eeo that Galileo, Descartee, Newton, Lavoisier, Laplace, bave changed the foundation of human thought in modifying totally the idea of the universe and its laws, in substituting for the infantile imaginings of non-scientific ages the notion of an eternal order, in wbicb caprice and particular will have no thought? Have they diminished the universe as some think? For my part I think tbe contrary. The skies as we see them are far superior to that eolid vault epaagled witb shining dots and upborne some leagues above us by pillars whicb contented the simpler ages. I do not mucb regret the little epirits that had wont to guide the planets in their orbits; gravitation does the work much better, and if, at times, I have a sad remembrance of the nine angelic choirs wbeeling round the orbs of the seven planets, and for the crystal sea that lays at the feet of the Eternal, I console myself with the thought that the infinite into which we look is really infinite, and a thousand times more sublime to eyes of true contemplation than all the azure circles of Angelico of Fiesole. M. Thiers rarely allowed a fine night to pass without gazing upon that boundlese eea. "It is my mass," he said. In bow far do the chemist's profound views upon the atom surpass the vague notions of matter on which the scbolastic philosophy was fed!—*Renan.*

THE PHENOMENA OF ANIMAL PHOSPHORESCENCE.—Ray Lankester calls attention to the following suggestive treatment of the phenomenon of phosphorescence in animals by H. N. Moseley: "The light emitted hy phosphorescent animals ie quite possibly, in some instances, to be regarded only as an accidental prodnct, and of no use to the animal producing it, altbougb, of course, in some cases, it has been turncd to account for sexual purposes, and may have other uses occasionally. There ie no reason why a constant emission of heat, sucb as takes place in the case of our own bodies, and it is quite conceivable that animals might exist to which obscure heat rays might he visible and to which men and mammals generally migbt be visible."

PLANT AND ANIMAL LIFE.—A striking analogy between animal and plant life has been diecovered by M. Van der Harrt, of Utrecbt. When the common garden beau begins to sprout, it is found to contain a fermeut very closely resembling pepsin, which can be extracted by means of glycerine. Thie ferment has the power of cbanging albuminous into peptonic substances, and starch into glucose. It is found exclusively in the cotyledons. In tbe case of flesh-eating plants, all the steps of digestion seem to take place in the same manner as in animale.

A NEW THEORY OF THE NATURE OF WATER. M. Maiche, in *Les Mondes*, propounds the theory reached aftcr uumerous experimente tbat water is simply hydrogen *plus* electricity, or oxygen *minus* electricity; or in otber words, tbat normal electrified bydrogen constitutes water, and tbat normal diselectrified oxygen produces the same; or tbat hydrogen, oxygen and water are precisely tbe same, differing only in degree of electrification.—*Scientific American.*

ALLOTROPISM IN METALS.—Mr. Schutzenherger, a Frouch scientist, who has recently paid much attention to the allotropic forms of metals, has now announced that he bas succeeded in obtaining antimony, copper, lead and silver in allotropic forms by precipitating the metals from saline solutions by electrolysis and otherwise.

THE BLUE FLAME FROM COMMON SALT.—Dr. Percy Smith has made a spectroscopical investigatiou of the cause of the blue flame given off hy common salt and other chlorides wben thrown into a hot fire. It is not due to either carbon or sulpbur, but simply to hydrochloric acid.

Mining Share Market.

The stock market continues healthy. Since the inception of the present activity the growing character of the market has steadily developed, till from the present outlook there is every indication of an immediate strong and widespread improvement in affairs. There have been fluctuations, many and violent, but in every case the recession has been followed by reaction, and the net result has been forward. We have again to notice a phenomenon before spoken of, viz., that the wildcats and more worthless stocks are in the lead and much more active than those more legitimately worthy. This is especially to be seen in the Bodies. The present advance may be referred chiefly to two causes, first, the spirit of speculation induced by the increased interest and larger investments of Eastern operators in our favorite stocks; and second, the actual developments made of late in many mines, together with the brilliant prospects held out by many others. Bodie, if not in the lead, has at least divided the honors with the Comstock during the past week. Both fluctuated largely, the one rising generally as the other receded. There is one class of operators who refuse to deal in anything but the Comstocks, and to these is the increase of business in these stocks during the week largely due. Dealers have not yet become wholly confident, but they are wide-awake and thoroughly watchful, and ready to embrace any and every opportunity which may offer a reasonably safe investment.

A Fountain Pen.—The McKinnon fountain pen, a device recently introduced here and which we have used, has a hollow handle in which a supply of ink is carried, and the fluid flows from the point in the act of writing, thus avoiding the necessity of the use of an inkstand. One of the main difficulties in this class of pens heretofore has been to insure a free and certain delivery of the ink, and also to bring the instrument within the size and weight of an ordinary pen. This is a handsome implement and writes smoothly, being somewhat like a lead pencil in this respect. A feature in its construction is that there is no liability of blotting or dropping of ink. It is very easily filled and the supply will ordinarily last for several days. It may be carried in the pocket like a pencil, and is ready for use at any time. The general agency for the Pacific coast is at No. 24 Geary street, also at the Palace and Baldwin hotels, in this city.

Poor, But Gifted.—Two men, under the advice of Mrs. Bowers, the seeress, are digging for coal out on the deserts of Nevada. This lady is able to indicate the locality of mineral bodies; a gift, in her case, connected with two marvels, one of which is that she herself remains miraculously poor.

The Russian bridge over the Volga, now in progress, is to be over four miles long and will cost $3,500,000.

A great increase of European immigration is setting in towards the United States.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Lincoln.—*Ledger*, May 31: The Lincoln mill has temporarily suspended operations. Work in the mine continues. Contracts have been let for running levels, and while the work is progressing it is thought unadvisable to try to keep the mill running. It will probably take till July to get the developments sufficiently ahead to commence crushing rock again.

Miscellaneous.—At the Amador gravel claim, hydraulic operations were started last week, but it was found necessary to shut down, owing to the weakness of the branch ditch. A force is at work repairing and strengthening the water way, and in a few days more the washing process will be resumed. The Keystone last month cleaned up $41,000. It has been decided to have a clean-up twice a month, the amount of bullion being too large to handle in one day. The last clean-up made was for a run of two weeks, and yielded over $10,000, independent of sulphurets. A partial clean-up was made recently on C. D. Horne's gravel claim, at Butte City, which turned out handsomely. The developments in the Gover mine, at New Chicago, have not been so encouraging lately. Another assessment of 50 cents per share has been levied upon the stockholders. The Oneida mill is running only 20 stamps at present. The Consolidated Amador mill is still running on gouge matter from the refuse dumps. A contract for sinking another 100 ft in the new shaft has been let. The new shaft near the Mahoney ground is making rapid progress downwards. The new hoisting machinery lately purchased in New York, is expected soon. It is reported in Sutter that the Wildham mine has been sold to a New York company.

Plymouth Notes.—The Plymouth mill and mine are henceforward to be closed on Sunday. A change in the underground foremanship has taken place. Jackson Little, an old miner in the Phœnix, is now boss. Timbers are coming down the ditch pretty freely now, and soon they will have a good stock on hand again. There is talk of sinking a new shaft south of the Phœnix. A man named Hill is negotiating for the Empire mine at Enterprise; and if suitable terms can be agreed upon with the owner, work will shortly be resumed. Water has been struck in the New London mine, and the workings have come to a standstill in consequence, hand power being too slow a process of getting rid of the water.

CALAVERAS.

Mill Repaired.—*Chronicle*, May 31: The five-stamp battery at the Safe Deposit mine, Old Woman's gulch, formerly the Hoey & Sliter, has been overhauled and thoroughly repaired. The battery is now in condition to do good service, and work will be pushed forward in the mine with renewed vigor. The Safe Deposit, under the superintendency of E. Rigney, Esq., is paying handsomely.

New Mill.—The new 10-stamp quartz mill that for some time past has been in process of construction at the Mount Tmolus mine, Jesus Maria district, is completed. The machinery has been put in motion, and worked first-rate for a first trial.

West Point Items.—*Citizen*, May 31: Everything in the shape of mining is looking very favorable. Mr. Thos. Portcoe and John Roe's quartz mill broke the machinery recently. It came in contact with a quartz boulder of about 1,000 pounds used for a drag that caused the collapse. They had a resort and adopted it immediately. They went to work and cleaned out their arastra and obtained 114 ounces of hard squeezed amalgam, and started for the nearest foundry for repairs. Mr. T. Fenneesy and his partner have been cleaning up lately. Their rock paid $50 per ton.

EL DORADO.

A Good Yield.—*Mountain Democrat*, May 31: Superintendent Chase, of the McClellan mine, Mud Springs township, reports a yield of $1,000 from three and a half days' run on rock from the main shaft.

INYO.

Modock.—Since making connection between shaft and upraise, they have been putting connection drift in shape for bulkhead and connecting with pipe to face of tunnel. They have this work well along, and will commence prospecting as soon as this is finished. Tunnel on 1000 level has been run 50 ft, and is still in fine ground either for ore or progress. The showing for a continuation of the ore body in first stope, 1000 level, is excellent. They have some very high-grade ore standing in this stope, and the prospects for its again opening out are very good. Assays from two pieces from this point yesterday ran $2,200 and $2,800.

Rex Montis.—Messrs. Potter & Ward, of the Rex Montis, after their recent thorough examination and investigation of the company property, have authorized the resumption of active mining and milling operations on a large scale. An order has been given the Black Rock sawmill for supplies of lumber and timbers. A force will be put upon the mines, extracting ore and prospecting. The mill will be run on company or custom ore continually. In the purchase or working of outside ores, the most liberal terms are offered to prospectors and miners for ore of all descriptions that will pay to work. A lot of about 20 tons of fine gold ore has been already purchased for the Fish Springs mine, which will be put through immediately. The reputation of Supt. Holt and foreman Walker for ability and fair dealing in such matters will be sufficient to set many mine owners at work getting out and shipping ore.

Indiana.—Messrs. Boley & Tuttle continue the work of extracting rich ore from their mine near Swansea. Assays made by Mr. Woodhull of the three samples taken from the dump piles showed—No. 1, 1,595 31-100 ounces in silver per ton; No. 2, 770 40-100 ounces, and No. 3, 648 ounces. A shipment of 10 or 12 tons of this class of ore to San Francisco is now being made.

Mines Opposite Independence.—Confidence No. 1 and Confidence No. 2 are the property of the old San Carlos company. A shaft 72 ft deep has been sunk on No. 1. The ledge shows a width of about three ft, the pay streak from 12 to 20 inches. The ore is black, rich looking, copper-stained metal, the assays averaging $72 per ton in silver and from 8% to 10% of lead. Occasional small kidneys of black lead ore have been discovered in the vein matter, which assay as high as $400 per ton. This ledge cuts across the canyon, and its course to the northwest is plainly defined as it ascends the opposite spur of the mountain. Confidence No. 2, or the middle ledge, bears about the same description as to size, but carries much finer ore; it is quartz with black sulphurets of silver. Assays of unselected samples resulted in $70 silver and $8.80 in gold per ton. A tunnel 65 ft in length has been run to tap the ledge a little less distance in depth, and stops about 30 ft short of getting anywhere. The deepest opening is only 18 ft in rich ore at the bottom. The ledge has been stripped 1,200 ft, showing a streak of fine metal every few feet along its surface course. Running along the summit of the hill and parallel with the mines below, is the Bluebird mine, belonging to the same parties. In this the vein of ore is slightly smaller, but the gangue and wall rock appear more favorable and more indicative of a permanent, contact vein. The ore sampled and assayed runs $61. A shaft 20 ft deep exposes ore and well-defined ledge matter to the bottom. All these ledges stand nearly perpendicular, the ore belts cutting through at nearly right angles with the general formation. On top, and so far as they have been opened, these claims certainly look well. About 45 tons of ore stacked up at the several dumps—the richest of which has not yet been tested by assay—attests in itself to their present and probable future value.

New Mill.—Messrs. Phillips & Woolsey have purchased battery, etc., from the old Cervantes mill at Lone Pine, and have the same now on the ground at Crysopolis, for use in the construction of a five-stamp gold and silver mill. Such a concern has come to be a necessity for that side of the river, and mine owners in Union district will not be slow to avail themselves of its advantages. Besides the mines being opened by Messrs. P. & W., the mines of Hopper, Cartier, Densmore and many others, will contribute their quota of rich ore to keep the mill producing bullion.

MONO.

Placer Mining.—*News*, May 27: The "salted" placer mines still hold out, as evidenced by the work being done on Green street, above Wood. Jim Land has had the under-pinning of his house shoveled away by miners, and is now up in the air on stilts, so to speak. The old-fashioned rocker, planted directly in the middle of the road, with an industrious miner constantly at work rocking away, is suggestive of the old days of '49. The men at work, both in sluicing and at the rocker, are doing well; in fact making upwards of $5 per day to the man. There is plenty of gold left in the gravel which covers Silver Hill, and more room left for men who wish to work.

Lucky Jim.—This is the name of a new discovery made on the east slope of Bodie bluff, which promises to exceed in richness anything yet found in the district. Lucky Jim, while strolling over the hills, came upon a formation which he judged sufficiently encouraging in appearance to warrant a little outlay of muscle; he went to work on it and now has a shaft 85 ft deep. It is located 1,000 ft northeast from the Dudley mine, and from the distance followed down shows fine gold interspersed throughout the rock. At the bottom of the shaft a vein two and one-half ft in width has been uncovered, and the indications are that it will widen as depth is attained. The prospect for a mine in this locality is exceedingly encouraging, and adds another proof to the theory of the eastward trend of the ore channel on Bodie bluff.

Red Cloud.—East crosscut on the 400 level is in 312 ft from shaft; progress during the week, 30 ft. Are running for Westchester ledge, which is the extension of the Defiance. Cut the ledge in the shaft at 250 ft, and obtained assays varying from $20 to $43. In 30 days, developments of worth and interest may be looked for in this mine.

Maryland Con.—Work is still being carried on vigorously at this mine, and with most encouraging results. The vein being followed down, is now two and a half ft wide of good ore, with every indication of improving in quality and quantity as distance is attained.

Richer.—Shaft down 250 ft. Have gained a distance of 190 ft in the north drift, and find good ore in fissure, coming in in streaks of from five to ten inches in width, and bearing every appearance of soon consolidating into a fine ore body. About the 15th of June the main shaft will be down to the 300 level, when important developments may be looked for.

Standard Con.—*Standard*, May 29: The north drift from the east crosscut, 385 level, main shaft, has been advanced 10 ft; total length, 210 ft. The ledge is 15 ft wide, of very fine ore. The upraise on this ledge is up 90 ft; progress, 15 ft. The ledge here is four and one-half ft wide, of good ore. The winze on the Cook ledge has been sunk 13 ft during the week; total depth, 97 ft. The ledge in the bottom is two ft wide, of good ore. The west crosscut, 700 level, is in 155 ft; progress, 15 ft. There has been no change to note in the character of the formation passed through. The rock is still very hard. The south drift on the Gildea ledge has been extended 17 ft; total length, 176 ft. The ledge is three ft wide, and looks well. The stopes are all looking very well. In the West Standard, the ledge is 12 ft wide, of very rich ore. Some ore has been stoped from the Gildea. The ledge is three and one-half ft wide, of very fair milling ore. In the stopes, 550 level, south drift, the ledge averages five ft wide, of good ore. In the south drift, 300 level, the ledge is three ft wide. In the north drift, 200 level, the ledge, where stoping is being done, is four ft wide, of good ore. The ledge in the stopes, north drift from main shaft, is four ft wide, and looks well.

Bodie.—The main east crosscut, second level, is in 170 ft. The west crosscut, on the same level, is in 97 ft. The west crosscut, third level, is in 177 ft. West crosscut, same level, 59 ft. Drift No. 1 north, third level, is in 189 ft. Drift No. 2 north, same level, 09 ft. Drift No. 2 south, same level, 47 ft. The two last drifts are on the new vein. Winzes are going down on this vein in both the north and south drifts. An upraise is also being made on this vein, which is now about 50 ft above the drift. The first level in the Bodie mine is 200 ft from the surface in the new shaft; the second level is 306 ft; and the fourth 433 ft.

NEVADA.

The Providence Mine.—*Transcript*, June 1: The prospects of the Providence mine, in this district, are gradually improving. New ore bodies are being opened by the development of an additional series of veins that run in the fissure, which is over 150 ft wide. It has two incline shafts, which have reached a depth of 1,200 ft. There are thousands of ft of ground opened up, and vast quantities of ore in readiness to be transported to the mill. There are stopes on the 600, 800 and 900 levels, from a single one of which six men could take out enough rock regularly to keep the present milling capacity of the company in operation for years. The 600 and 800 levels are nearly 2,000 ft long, showing pay ore the entire length.

Talbot's Gravel Claim.—Talbot's blue gravel claim, at the head of Gold Flat, is looking well. The channel has been prospected for a distance of 200 ft on the line, and is opened up for about 600 ft. Lately some rich nuggets of gold were found on the bedrock. The lead varies from six to ten ft in thickness. It underlies all former workings, and was discovered at a comparatively recent date.

El Capitan Mine.—Work on the El Capitan mine has been progressing favorably. The incline is down 42 ft, and water has been struck, which will delay further sinking until machinery can be erected. In the meantime, the workingmen will be kept busy taking out ore.

Other Notes.—*Foothill Tidings*, May 31: Rube Thomas continues to run his hydraulic claims on the "Slide" day and night, the late rains having kept up the water supply better than he hoped for. Splendid rock is continually coming from the Knight of Malta mine. It took two days to repair a break in the main ditch of the South Yuba canal company which occurred recently near Bear Valley. C. Hersh, a prominent mining expert of San Francisco, has been viewing some of the leading mines in Nevada and Placer counties in the interests of San Francisco capitalists. He is more than satisfied with the outlook. The Blue Tent company and Sailor Flat hydraulic claims at Blue Tent are having an unusually profitable season. D. T. Hughes, Superintendent of the former, says that water is plentiful and the supply will last for some time yet. Moore's Flat is quite dull at the present time, as there are only two mines being worked. The Boston company is the only one running which employs white labor. About 50 men are kept at work in this claim. The other mine being worked is the Chinese claim. A large cave which occurred in the south side of the bank at the Manzanita mine last week, will save the company $1,000 worth of blasting and hydraulicing. M. Oarver, Esq., for some time past Superintendent of the Murchie mine, has resigned his position, said resignation to take effect June 1st.

PLACER.

New Mine and Mill.—*Herald*, May 31: Messrs. Stewart and Low, last summer, commenced running a prospect tunnel into a gravel hill a little over two miles below Auburn. They would occasionally leave their tunnel and prospect more or less on the quartz veins in the same vicinity. In this way they discovered several quartz ledges that prospected well, and on one in particular, the indications were so flattering that they were encouraged to take active steps for its development. They sunk on the ledge some depth, and still finding the rock rich, they went to work to erect a five-stamp mill. This mill was recently completed and is now in operation, and from the best information obtainable, the rock they are running through is very rich. In addition to their quartz mine, they still keep at work on their tunnel, and have just reached the rim of the channel.

More Enterprise.—E. W. Roberts, some years ago Superintendent of the old Auburn quartz mine, on Rock creek, has returned to that district and commenced active operations. He has taken hold of the mine heretofore operated by Heenan and Molin, on Rock creek, and has also put men to work cleaning out the shaft on the old Crandall mine, on Duncan hill, for the purpose of enabling a better examination of the ledge, with the view of bonding or buying it.

SIERRA.

North Fork.—*Mountain Messenger*, May 31: This claim is now paying considerably over expenses, and is about clear of debt. The owners deserve much credit for the tireless perseverance with which they have brought out this mine; and it now bids fair to soon become one of the most remunerative in this section of the country. Present indications are that the quartz ledge may soon yield rich ore. A new air shaft is being constructed. Work is still suspended in the South, but may be resumed in summer.

Bald Mountain Extension.—Watson Bayles is now in nearly 800 ft with the air-line tunnel and the bedrock is so soft that it can be easily broken and pulled down with little effort. It is believed that but little or no hard rock will be encountered in the progress of this risky but promising financial venture. Thus far over $6,000 has been expended on the tunnel. Only 200 ft remain to effect the completion of the present contract.

Kenton.—The prospects of the Kenton quartz mine are daily improving. An extensive body of rich ore is developed and ready for extraction. It is safe to say that over 1,000 tons is now in sight in the mine. The taking out and crushing has now been going on for several weeks, and with highly favorable results. There is sufficient water to run all the machinery, and the expense is consequently light. About 20 skilled miners are now employed at the Kenton, besides a considerable force of other workmen.

TUOLUMNE.

Oroveland.—Cor. *Independent*, May 31: The "Spring mine" is still on the improve. The owners have now drifted into the hill from the ravine, where Barnes' spring is situated, about 30 ft, and are now about 20 ft below the surface of the ground at the end of the drift, where they have made a crosscut to ascertain the width of the vein, which proves to be 10 ft and is composed of alternate layers of partially decomposed yellowish looking quartz and gold-bearing talc slate, dipping at an angle of about 45 degrees to the north. There are no croppings at the surface to indicate the presence of the vein. The ravine below the mine had been very rich, and at an early day had been thoroughly mined up to the point where the vein crosses it, but very little attention had ever been paid to the vein itself, although there had been two or three little holes dug in it a few feet deep; but nothing seems to have been found to encourage farther exploration at that time, and probably would not for many years to come, had not some strangers happened to drift into the village, having a prospect of permanent work at the Mount Jefferson mine or mill. But the mill where they were employed having stopped for want of rock, two of the millmen, after trying several other places without any very marked success, had this place pointed out to them, and finding a small prospect which they thought would justify further research, they located a claim 1,500 ft in length, and commenced in a moderate way to sink and drift upon the vein; as they went down, or further into the hill, the rock seemed to improve, until they began to think it worth while to try some of it in the mill; failing to get the use of the mill they suspended operations for awhile. Work has been recommenced, they have taken out more rock, and finally got the use of the mill and put through about 12 tons; which turned out rather above their expectations. They have been at work ever since developing the mine and taking out rock, and now have quite a large pile upon the dump ready for the mill. Samples from different parts of the mine and the dump were assayed, in every instance splendid results being obtained, ranging from $20 per ton way up into the thousands; and this rock was taken from different places, the whole width of the vein, not less than 10 ft wide.

NEVADA.

WASHOE DISTRICT.

Union Con.—Gold Hill *News*, June 4: The joint Mexican incline winze from the 1000 level has connected with the joint upraise from the 2000 level to meet it, and greatly increased ventilation on both these levels is the result. The main north drift, 2000 level, is making about six feet per day through hard porphyry; total length, 370 ft.

Belcher.—The drift east from the 2700 station is in 50 ft, and in very favorable looking ground. Sinking in the incline has been resumed and it is now 40 ft below the 2760 level. The crosscut, 2500 level, 430 ft south of the incline, is in 60 ft, its face in a good-looking formation of quartz and porphyry.

Con. Virginia.—The west drift, 850 level, is now in 250 ft, and continues in hard, blasting porphyry. The south drift, 1500 level, running west of the old stopes, is in 68 ft from crosscut No. 2. Crosscut No. 1, 1850 level, joint with California, is being advanced as usual through low grade quartz, ventilation having been greatly improved by a fan set up for the purpose.

Alta.—The drifts north and south on the 1750 level are progressing favorably, that south into Alta ground being in 50 ft and that north into Benton 40 ft. Drifting north on the 1450 and 1550 levels, both workings being in quartz.

Sierra Nevada.—The ore stopes on the 2200 level continue to look well and are yielding their 65 tons per day of good ore. The flow of water still averages 125,000 gallons per day.

Sutro Tunnel.—Work is proceeding as usual. The sub-drain will be completed about the middle of July. Mr. Sutro declares, however, that this need make no difference with the mines, as he has contracted to take their water.

Julia Con.—The temperature of the 1300 and 2000 levels have been lowered considerably since the connection between the Hale & Norcross and the Julia branch of the Sutro tunnel. As a consequence, repairs to the workings on the 2000 level are progressing more favorably.

California.—The joint Con. drift west, 850 level, is averaging four and a half ft per day through hard porphyry. The north drift, 1950 level, from No. 3 winze, is in 30 ft. Sinking has been resumed at the C. & C. shaft.

Savage.—The pipe which is to convey the water of the mine to the Sutro tunnel is being sunk and covered to avoid the heat. The water is about at a standstill.

Mexican.—Connection has been made between the joint Union winze from the 1600 level and the upraise from the 2000 level, and the ventilation on these levels has greatly improved in consequence.

Ward.—The shaft has attained a depth of 1,473 ft, the bottom in good sinking ground, which, however, carries considerable water. East crosscut, 800 level, is in 620 ft.

North Bonanza & Flowery.—The incline has reached the 400 level. On the 200 level the north drift has been carried under the Rule winze, and an upraise is to be made from this level to connect with it. Two crosscuts have been run, and will be pushed forward as soon as that in Flowery gets into the vein proper.

Justice.—On the 1550 level the main lateral drift south and the west crosscut are encountering quartz giving increased assays as those workings approach the formation under the developments of the 1300 level. The workings from the new Waller Defeat shaft turn out from 55 to 60 tons of ore per day, of which the greater portion is of high grade.

Con. Imperial.—The north drift, 2600 level, is averaging six ft per day toward the point where the joint Alpha winze from the 2400 level will intersect it; total length, 256 ft, the face in quartz and porphyry.

Ophir.—The incline is 80 ft on the slope below the 2300 station. The face is in a favorable-looking formation containing stringers of quartz. The east drift, 2300 level, is in 70 ft and is passing through vein porphyry.

Trojan.—The northeast drift on the third level is in

Continued on page 372.

On Certain Much-Abused Mollusks.

[By Robert E. C. Stearns.]

In Victor Hugo's very popular novel, *"Les Travailleurs de la Mer,"* the domain of nature being either etale or insufficient, the enterprising author manufactured a new species, a monstrosity, which he invested with characters belonging to widely separate forms of animal etructure. If a hibernicism is permissible, it may be said that he *describes a nondescript*, mixing in an incongruous jumble unrelated peculiarities of different divisions of the animal kingdom.

The average uovel reader whose appetite is aroused by the motion or activity of the narrative, and whose interest is retained by the momeutum as well as by the glamour of Hugo's percussive and explosive verbal pyrotechny, it may be presumed is not sufficiently well informed iu euch matters either to notice, or be offended by, euch trivial crimes against nature.

Hugo connected his invention with the cuttlefishes by calling it *"la pieuvre,"* which is the provincial or local name among the fishermen of the Channel Islande for the eight-footed cuttles (Octopoda) of the region, the "Poulpe" of French authors. Herein lies his offense.

As, eoon after the appearance of this book, Mr. H. Crosse, one of the intelligent and able editors of tbe *Journal de Conchyliologie* (April, 1866), under the title of "Un Mollusque hien maltraite,"* pointed out Hugo'e numerous absurdities and special inaccuracies, there is no necessity for indicating them again; but as we have to notice other sins of a similar nature, if lese heinous, by other sinners, it may be well to quote in part the concluding portion, of Mr. Crosse'e justifiable and pertinent criticism:

"It is * * * the duty of those who have * * * devoted their lives to the study of science to point out and rectify euch gross errors, much more dangerous when they emanate from so eminent a writer as M. Victor Hugo than if they came from an obscure author. We must add that, though this unlucky chapter ie full of every kind of enormity and of facts absolutely false as to science, the paper of Parie which has the largest circulation, although not the most intelligent, has especially selected it as a specimen of the work, and transcribed it at full length with the most fulsome eulogies."

M. Crosse, in closing, ironically adds:

"We see thereby that the instruction of the masses in the natural sciences is in good hands and well directed. M. Michelet, also a confused *litterateur* in regard to science, had already drawn quite an amusing and fanciful portrait of tbe *Poulpe;* but after that eketched by Victor Hugo nothing more can be added. It ie easy enough to make it more accurate; but to frame it more fantastically would be almost an impossibility."

In the *Popular Science Monthly* for January of the current year (p. 345), we have a paper on "The Devil-fish and its Relatives," a chapter from a book† in press at the time, in which Hugo'e sensational name is adopted, and either for padding or piquancy, perhaps both, a part of hie "terribly vivid description" is quoted. The writer adds, as a mild qualification, "Though incorrect in several scientific details, the description is the best we have had, though Jules Verne's is almost as dramatic and nearer to Nature."

The title, and the foregoing extract, brief though it be, is sufficient to indicate to the scientific student or intelligent reader the quality of the article and the probable character of the book. If Verne'e "general description" had been a little more dramatic and a little further from Nature, we may assume that the author would have quoted him instead of Hugo! On a succeeding page (347) we are presented with a sensational picture, "Fig. 2. The Giant Squid," in tbe great double and daring act as the circus folk would expreee it, of clasping a square-ended skiff or boat, while at the eame time thie devilieh fiehy "Giant Squid," uot eatisfied with etealing the man's boat, is actually "going for" the man himself, and had, up to the last time that we look at the picture, already wound or twieted *three* arme around the man'e *two* legs. Such deliberately cruel conduct on the part of this "Giant Squid" indicatee that "The Devil-fish and ite Relativee" are cold-blooded animale, a fact of phyeiological importance; so inferentially we get an occasional chunk of knowledge to pay ue for the time expended. We left the poor man (perhaps a legal voter) in a precarious eituation, probably getting ready to "be *drunk* alive." The picture indicates that drunkenness in eome of its forms was prevalent at the time it wae made, for the proportions of this particularly malicious "devil-fieh" are not thoee of any known epecies, while to point the *tail* (if not the moral) the conventional devil's tail of the "old maetere" is grafted on or in thie unique form, in a way to produce a startling effect on weak nerves.

Will the author pleace inform us what particular epeciee of cuttlefish ie represented in the figure? It is undoubtedly a new form! The disproportionately emall eize of the fins (or tail), the peculiar form of the eame and mode of attachment, prove this to be a new, distinct, and rare epecies. Is it an octopod or a decapod? Though called a "squid," which would warrant the assumption that it hae ten arms, only seven are visible; however, the rest may be in the second cabin! As no one has ever eeen a cephaloped built on such a model, with the posterior portion of the body tapering and attenuated to a point, with a heart-shaped tail stuck on it, euggesting a whaler's bomb-lance, we are forced to the conclusion that Mr. Damon has discovered a new species, which he had better describe, ere the man in the skiff "is *drunk* alive." Before this, however, he should copyright the picture, and get a patent for the tail! On page 349 we are informed that "According to scientific classification, the octopus belongs to the division of soft-bodied *Mollusca*, and the class of *Cephalopoda*—meaning 'feet proceeding from the head.'" Is there a division of hard-bodied mollusca, and do the decapods belong to it? Again, we are iuformed, "Of the Octopoda family is the small paper nautilus or argonaut. How few of our readers who have admired thie beautiful shell, *with its mother-of-pearl lining*" (italics are ours), "have realized that its former inhabitant was own cousin to the horrible devil-fieh." Oh, my! there he goes again, and "poor but respectable" Mrs. Argonaut is defamed and charged indirectly with being a relative to, if not *particeps criminis* with, that apochryphal devil-fish of Hugo's. The *mother-of-pearl lining* in an argonaut shell ie something new. Mr. Damon has invented another epecies, or else he is ignorant of what he has written about. Produce your pearly-lined argonaut, and the dealers and conchological *dilletanti* of Europe aud America will purchase all your specimens at fancy prices.

Tryon, at the closo of his general remarks on the *Cephalopoda*, in his Manual of Conchology, referring to this paper, misquotee the title, but says, "Those who prefer modern marvels will find in it a choice assortment."

If such be popular science, the less of it the better.

In *Harper's Magazine* for February, we have a profusely illustrated article, entitled, "The Treasures of the Deep," in which the artist has done grievous wrong to certain helpless mollusks by making several right-handed or dextral forms, left-handed or sinistral, ae may be seen by turning to page 329, the upper group, which includes what the author calls "Venus' Comb" (*Murex tenuispina* of Lamarck); the second form covered with tubercles known to naturalists as *Murex haustellum* of Linnæus; also the cone-shell *C. nobilis*, the top-shell *Trochus niloticus*, and the shuttle-ehell *Ovula* (*Volva*) *volva*, (not *Ovalum valva*, as printed), are all thus misrepresented.

While certain species of Mollusca—marine, fluviatile and terrestrial—are einistral, the great majority are dextral or right-handed. A few epecies iu each of the three divisions are both dextral and sinistral, but the forms referred to above are always dextral.

As the author, on page 331, compliments "the accomplished artiets who cngravcd these shells and the cut of the uautilus," (more properly *Argonaut*), we may infer that the draughtsman is to blame for these perversions.

Ianthina communis, the violet snail, appears as *Ianthana*, and the author's idea of nacre is not quite lucent, when he tells us the spindle-shell ie "pearly white," and so one gets bit by bit, a scrap of information, until finally the scrap is reduced to a crumb, and the last crumb which we will refer to is that "*Spondylus regius* is probably the rarest shell in the sea," and Dr. Chenu's old story about the learned professor who sold his "wife's jewelry and silver spoons to purchase one of theee rare specimens," is reeurrected, et cetera, to point a moral or to give, as in a previous case, piquancy and padding to the prosy text.

Without guessing at the weight of the paper, we may pass on with the remark, that it is essentially light reading; from pearls to ivory may do, but from Cleopatra to Walrussee we fear will be regarded by readers of classical proclivities, as a new form of that old "etep from the sublime to the ridiculous." Mark Antony, Esq., being deceased, it is probable hie feelinge will not be hurt; were he around as formerly, he would certainly make it lively for the author. Readere of another clase will probably detect a elight top-dreeeing of diluted popular science.

In pursuance of the practical advice given elsewhere to Mr. Damon in relation to his pearly argonaut, we would suggeet that the creator of the sinietral monetroeities, figured in *Harper's*, ehould at once diepoee of his precious epecimens to the museume, where the curioue, whether ecientific or otherwise, may see them. They would command high prices, being undoubtedly unique.

From the monthliee to Webster's big dictionary* may he regarded ae paseing from gay to grave, from lively to eeverc.

Next to the Bible and Koran, mighty in all its massy corpulence and ponderoue dignity, comes the big dictionary! The solemnity of ite phyeiognomy is awful! In some portions of even Christian countries, where the Bible—alae!—ie little ueed, or only a emall-sized edition ie accessible, witnesees are sworn upon this portly tome. Next in potency to a rooeter to force the unwilling Mongolian to the truth, comes the big dictionary, with the myeterious power of its accumulated and concentrated wiedom.

Within the covers of thie awe-inspiring volume we might expect to find ample, unabridged, and impartial juetice. No! Even here certain defeneeleee mollueks are the victime of pictorial infelicities and left-banded compliments.

The *Cephalopods*, eo cruelly used by the otbers, are again badly treated. The definition of the word *Cephalopod* ie well enough eo far as it goes, but for a figure we are presented with the shell of an *Ammonite*. Upon consideration of the fact that the *Ammonites* are an extinct form, without a living representative for numberless centuries, and that the present seas of the globe contain numerous living species and multitudes of individuals of *Cephalopods*,* and that the figure given is wholly irrelevant to the definition; and that while the Ammonites were or are Cephalopods, the latter are by no means *Ammonites* any more than a horse is a mare, the absurdity of the foregoing is at once apparent. While the Ammonite and the Cuttle-fish are properly figured, the unfortunate Cephalopode are needlessly humiliated!

To illuetrate the family of *Entomostomata* we have two figures, viz.: 1. *Ricinula horrida;* 2. *Cancillaria reticulata*. It will be noted that the generic name in the latter is misspelt; it should be *Cancellaria*, as the caucellated sculpture of the ehells suggested the generic name. Both of these well-known dextral or right-handed shells are figured as sinistral; they are aleo presented apex down. When the actual shells are held in the proper position, with the apex up, it will be eeen that the mouth, as the opening is called, opens on the right-hand side.

Helix (4 Zool.), the snail shell, is represented by a revereed *Bulimus* or *Partula*. We should naturally expect to find a typical Helix as figured by some of the old authors, say *H. pomatia*, the snail of the Roman epicures, or *H. aspersa*, also an edible species, largely used in Europe both in ancient and modern times.

Melania aurita (see Melanian), a dextral shell, is made sinistral in the wood-cut, and nothing is said as to whether this numerous and widely dietributed form is marine, fluviatile, or terrestrial.

For *Nautilus* we bave a figure *Argonauta argo* (shell and animal) as stated; while the Argonauta is frequently called the "paper nautilus," the true nautilus shell is internally chambered, as stated in the accompanying definition, and is also nacreous or pearly, while the shell of the *Argonaut* is neither chambered nor pearly. The absurdity of the figure in this connection is made more conspicuous by the note which follows the definition.

Again, it is rather curious that while uuder the definition of *Mollusk* there is given in the group of figuree those of a recent *cephalopod*, as well as the true *Nautilus*, animal and shell (the latter in section, so as to sbow the chambers), also a *Helix*, animal and shell—that such inappropriate figures, to eay the least, should have been placed against each of the above words, as before shown. Ae to the definition of *Nautilus*, it should he said that the ehell is not spiral, but involute and discoidal. The definition of *Paludina*, though brief, is well enough; but the figure of *P. vivipara*, as given, is sinistral, aud the mouth, which in nature is simple, round, and continuoue, is made with a thickened and reflexed peristome.

For Periwinkle we are furnished with what is intended as a portrait of *Littorina littorea*, as stated in the definition (1 Zool.); a dextral shell between tide-marks, but sinistral, with its mouth on the wrong side, when found insido the covere or on the dry land of the dictionary. The large and showy shell, *Triton* (Tritonium now), always dextral, is represented by *T. tritonis* in the reversed figure. The same figure is made to do a double duty, like the chest of drawers in Goldsmith's "Deserted Village." For opposite the term *Trumpet Shell* "tother side" is placed uppermost, and we are told that it is "a univalvular ehell of the form of a trumpet, a species of *Buccinum*." This definition is neither eatisfactory as to the origin of the term, nor in the etatement of its conchological relations. The ancient sculptors and artists placed the shell in the hands of the sea gods, the Tritous, for whom the shell was named,† and who are generally represented with the apex to their lips, blowing the ehell. It ie ueed even now by the natives of eome of the Indo-Pacific islande as a war trumpet. In the early days of conchology, eome of the old authore grouped the geueral form with the *Buccinida*, but has long eince been removed from that poeition.

Againet the word *Turbinated*, we find a speciee of ehell of the group *Turbo*, as an illustration, figured as sinietral; of course in this connection it makee but little difference, a sinistral form illustrating the definition as well ae a dextral; hut not only the epecies reprceented (*T. Marmoratus*), but all of those to which it ie related are dextral ehells. The definition *Univalve* is illuetrated by a speciee of *Triton*; the name attached to it ie "Buccinum undatum," quite a different form.

Scalaria, always a dextral shell in nature, though einietral in the dictionary, is illuetrated by the common European *S. communis*. The popular name for the general form ie *Wentle-trap*. On turning to this word, a definition of which is given, a poor sinistral figure of the large Indo-Pacific epeciee, *Scalaria pretiosa*, is presented for thie well-known dextral shell. Even the common form *Strombus*, ehowy marine shelle, eome epecies of which are notably abundant, hence frequently met with in ordinary collections, and alwaye dextral, is repreeented by a left-handed figure.

Vertigo (2 Zool.). Defined as "a genus of gaeteropodous mollusca witb a cylindrically fusiform ehell." Upon turning to *fusiform*, a word derived from *fusus*, a spindle, we find the definition to be "shaped like a spindle, tapering at each end." The definition is the same as that in conchology. It does not apply to the shells of Vertigo, which are small, stumpy *pupiform* spiral shells, some species being einietral, and othere dextral, with curiously notched or twisted mouths.

We will not at this time prolong our inquiry into the conchological or malacological integrity of this, that, or the other big dictionary. Painful though it may be to point out the weak and human side in so pretentious a ponderosity, it is more painful etill to think of its inhumanity to those helpless forms, which have no Bergh to protect them, and which are also lost sight of by the various societies for the prevention of cruelty to animals! And here wo will close with these appropriate lines from Cowper, which might have been written for the occasion:

> "I would not enter on my list of friends
> (Though graced with polished manners and fine sense,
> Yet wanting sensibility) the man
> Who needlessly sets foot upon a worm.
> An inadvertent step may crush the snail
> That crawls at evening in the public path;
> But he that has humanity, forewarn'd,
> Will tread aside and let the reptile live."

Down the Columbia to the Sea.

The Columbia river is the natural outlet for all the vast region drained by its waters and is destined to be the principal channel of commerce for the immense trade which will come as soon as there is railroad connection between the great river of the West and the Union Pacific railroad. The great advantage which this route presents in its freedom from deep snows and its directness through the center of the country to be traversed more than counterbalances all the disadvantages and difficulties attending the entrance over the bar at the mouth of the river. Since the day that Capt. Gray entered the river with the ship *Columbia*, without a pilot, and without any previous knowledge of the waters he was navigating, thousande of vessels of every description and capacity have crossed the bar coming in and going out at all seasons of the year and in all kinds of weather. That accidente should have somctimes happened to vessels is not surprising, as the same thiug has occurred at the entrance to every port; but it is remarkable that after all that has been said about the difficulties and daugers of this passage, not an inetance is on record where a vessel known to be seaworthy and entering the river in the day time and with a pilot has suffered any serioue accident. Even were the dangers of navigation real instead of being iu a great part imaginary, and the accidents to vessels tenfold what they have been, the river would still continue to bo navigated and its entrance continue to be one of the principal harbors on the Pacific coast. It is very well known that the loss of the *Great Republic*, which, though one of the largest steamers afloat, had so often come in and gone out in perfect safety, was in no way owing to any real danger existing on the bar and in the harbor, but solely to the carelessness of the captain and the pilot in coming in after night. It is perfectly safe to say that with a proper degree of prudence and care on the part of masters of vessels and pilots accidents would be of as rare occurrence at the mouth of the Columbia as at the entrance to any other port.

The people of the Puget Sound country, and those of the upper Columbia basin, are naturally in favor of the route across the Cascade mountains from Priest Rapids on the Columbia to Seattle or some other point on the sound. The advantages and disadvantages of this ronte they will have an opportunity of testing when the Nortb Pacific is completed, as it ie now pretty well settled that that road will be built across the Cascade mountains to the sound.

For the people of southern Idaho and eastern Oregon the route down the Columbia will bs preferred for many reasone, while their interest in the other route to the eea is confined to whatever of favorable competition it may bring.—*Idaho Statesman.*

The Robertson Process.—What is called the Robertson procees of treating rebellious ore ie the invention of John A. Roberteou, of Oakland, Cal. It ie eo simple and uncomplicated that one wonders it wae not thought of before. The Reno *Gazette* saye that W. H. Tredway of that place hae experimented with ores from a number of minee, all of them more or less rebellioue, with uniform euccese. The coet of working ores is trifling and all kinds of ore yield to the same treatment. Mr. Tredway's method is to break the ore up into emall pieces, after which he roaste it in an ordinary portable assay furnace of iron. When it is eufficiently roaeted, it is thrown, hot, into a chemical hath, made by diesolving salt, blueetone and syenite of potaseium in water. The ore ie then washed off with cold water, placed in a miniature pan mill, and ground to a fine pulp, quicksilver being put in to amalgamate the precioue metals. After roasting, the ore ie eoft and brittle, and grinde up easily. The pulp is then panned in an ordinary gold pan, and the amalgam retorted in a simple retort made eepecially for prospector's uee. The erection of a furnace and treating the oree with the chemical bath would be all the changes neceseary in an ordinary stamp mill, for working ores by this procese. Reduction works on the Robertson plan are in euccessful operation in Sacramento, with a capacity for about one ton per hour.—*Silver State.*

*A translation may be found in the *American Journal of Conchology*, Vol. II., pp. 294, 296.

†From "Ocean Wonders," in the press of D. Appleton & Co.

*Webster's Unabridged Pictorial Dictionary, 1876.

*The common squid used as bait by fishermen is abundant on portions of the coast of New England; and the large *Octopus punctatus*, Gabb, is not rare in the fish markets of San Francisco.

†*Vide* "Woodward's Manual."

The Winnemucca and Oregon Railroad

The projected railroad from Winnemucca to Oregon is again attracting attention. Some four years ago Congress granted the right of way through the public domain to this enterprise, and the belief was general that work would he commenced on the road immediately. Subsequently a corps of engineers, under the auspices of the Central Pacific Railroad Company made a preliminiary survey of the route, but for the past two or three years nothing has heen made puhlic relative to the matter. It was predicted at the time when it was said arrangemeuts were completed for the grading of the road, that it would not be built until self-protection compelled the Central Pacific Railroad Company to do it to prevsnt an opposition road from being built from tbs terminus of the Union Pacific west through Idaho to Oregon. That time is now at hand. The Utah Northern railroad, which connects with the Uniou Pacific at Ogden, is heing pushed rapidly, and there is a strong prohahility that that road will he continued west through Idaho to Oregon.

The policy of the Central Pacific Company seems to be to control all railroads running saatward from ths Pacific coast, and to prevent competition from the seaboard with the Union Pacific. The company will thersfore havs to build a hranch line from Winnemucca or some place in this vicinity to the northwest to prsvent tbe Utah Northern, which ie being built by Jay Gould, from continuing that road west through Idaho. Winnemucca is the most northerly point touched hy the Central Pacific road in central Nevada, and is therefore the most eligihle place for the intersection of a road to Oregon. Beeides, there is a beavily timhered region within 200 miles of here on the line of the proposed road, which of itself will be a great inducement to huild the road, as Nevada and Utah must always depend on tbe Sierra Nevada for tbeir lumher supply. Reno will make a determined effort to have the road built north from that point; but as it is about 100 miles south of Winnemucca, its general geographical position is against it, and unless its citizens offer extraordinary inducements in the way of suhscriptions, it will not be likely to secure the coveted prize.—*Silver State.*

Cajon Pass Coal.—There are, at present, two separate companies who are running tunnele on promising veins. The first is composed of Messrs. Lawrence & Tay. They have run a tnnnel into the hill on the east side of tbe road running through the pass, about half a mile north of the toll-house and some hundred feet ahove the road. This tunnel has heen driven ahout 60 feet, following the dip of tbe vein. This was about 45 degrees at the surface, hut is gradnally approaching the horizontal. The hanging wall is saudstone and the foot wall clay, which is regarded as an exceedingly favorahle indication. Although the vein was scarcely more than a trace on the surface, it has steadily widened until it is now over a foot thick. The coal is hard and compact, presents a shining fracture, and seems to he almost free from eulphur. J. S. Bright has tried it in the forge for hlacksmithing purposes and pronounces it to be very good. The company is determined to prosecute work until it shall thoronghly demonstrate the value of the mine. At present their prospects seem to be bright. On the west side of the pass a company, composed of Messrs. Sisemore, Snyder, Bennett and others, have commenced two tunnels. These are three-quarters of a mile farther north thau that on the east side, and have heen run in horizontally, cutting the vein the whole way. The first is in fifteen feet and the other eight feet. This vein dips at an angle of about 70 degrees, and seems to be of as good quality as the other. This company expect to prosecute their prospecting vigorously, and will soon he able to tell definitely what may he expected.—*Colton Semi-Tropic.*

The Utah Northern Railroad.—A writer in the Salt Lake *Tribune*, who has heen contrihuting a seriee of able articles on the "Resources and Attractions of Utah," hae the following to say concerning the railroad which is now advanced to Snake river: The Utah Northern is a protege of the Union Pacific. It is narrow-gauge; starts north from Ogden, runs along the base of the mountaine about 45 miles, crosses a low summit into Cache valley, strikee across eastward to Logan, then north to Franklin, just over the Idaho line; thence it escapee via Marsh creek, and descends the Port Neuf to Snake river. It is now completed to the Eagle Rock crossing of Snake river, ahout 200 miles from Ogden, and will doubtless be continned northward into Montana, and northwestward through Idaho to the mouth of the Columbia. The road was etarted to accommodate the local settlements rather than as a through line; hence its comparative indirectness and the width of ite gauge. It is the only means of access to northern Utah and eouthern Idaho, the banks of whose principal river for 200 miles in length containe gold enough to make placer mining profitable. Snake River valley and the rich silver mines on the head of Salmon river are at present the attraction which fill the eyee of the roving prospectors for mines, and the Utah Northern is sure of a prosperous future. About 80 milee of it are in Utah, and it will he a Utah road etill, when it shall have reached the Pacific with its left and Saskatchewan with its right arm.

Useful Information.

Spontaneous Combustion—Some Remarkable Cases and their Explanation.

M. Cosson recsntly called ths attsntion of the French Academy of Sciencs to a singular accident that had occurred a short time previously in his lahoratory. Eight days sgo, said hs, my lahoratory hecame ths scsne of a sudden outbreak of firo. The board flooring in the neighborhood of a stove spontaneously ignited. In consequencs of a similar accident, two years ago, I had caused tho hoard in the vicinity of the stove to bo replaced by a marhls slah. Notwithstanding this precaution the fire broke out in the wood around the marhle. Ths heat to which tbe wood was exposed at the points where it ignited was not very great; the air had only a temperature of 25°. But without douht there had been a slow carbouization of the wood and a rapid ahsorhtion of the oxygen of tho air, and in consequence a production of caloric sufficient to cause ths combustion. Heroin lies a danger which should he impressed on the minds of architects and huilders.

This reminded M. Faye of a case of spontaneous comhustion that had recently occurred at the houss of a friend of his at Passy. The fire was due to the continuous action of the heat of a stove on the surrounding wood-work.

M. Dumas adduced several analogous examples, all of which he explained by that property of finely divided bodies wherehy they ahsorh air very energetically and generate heat. In powder factorics, for instance, the pulverized carbon very often ignites of itself. It is for this reason tbat the practice has heen generally adopted of pulverizing it in conjunction with eulphur, because sulphnr deprives it of the property mentioned.

In such instances as those cited, tbe wood deprived of its moieture by long exposure to heat becomes transformed into a euhstance analogons to lignite or peat. In fact, it ie changed into a condition that may be compared to that of powdered wood. In this state it condenses the air and takes fire. It wae thue that, on one occaeion in his experience, a beam in a coach-house exposed to hot air took fire spontaneously. Sometimee in theaters the lampman's box, filled with miscellaneous oily rubbish, becomes spontaneously ignited. The greasy odds and ende contained therein condense the oxygen of the air. In manufactories where Adrianople red is applied on cotton impregnated with greasy material, spontaneous comhustion takes place very often.

M. Dumas cited one more singular fact of which he was a witness in the etudio of a painter. The artiet had taken a piece of cotton to hrush and clean his canvas. He gavc the oily eurface a good rubhing and put the cotton aside. Very soon the cotton ignited epontaneously.

The all-sufficient explanation of these and like cases ie the fact that a minutely-divided and air-conducting suhstance has the capahility of producing suddenly a high temperature.—*Exchange.*

To Detect Gas Escaping.—To find the leak, first see that no buruers have heen left accidentally turned on. Thie is often the case where the cock has no stop, and ie caueed by the cock being partially turned around again so as to open the vent. Imperfect stop-cocks for this reason are dangerous, and shonld be promptly repaired. Try all the joints of the gas-fittings, by bringing a lighted match near them, to ignite the escaping gas if any there he. In case it is found by the sense of smell that the gas is escaping either within the floor or walle, do not on any account apply a match near a crevice. Turn off the gas at the meter, and send for a gas-fitter at once. In ordinary leaks, the burner or joint should be unscrewed, and white lead or common bar-soap rubhed in the threads hefore screwing home again.

Stout calico ie made water-proof by the Chinese with a preparation which provee efficient in any climate, and is eupposed to be composed of the following ingredients: Boiled oil, one quart; soft-eoap, one ounce, and beeswax, one ounce, the whole to he boiled until reduced to three-quarters of its quantity when mixed. The calico treated with this mixture answers well for life-saving apparatus.

Salycilic Acid as a Preservative of Water.—A German scientist has preserved drinking water containing much organic matter for three years by adding one grain of salycilic acid to one pint. The water was kept in a stoppered bottle which was opened from time to time, and it tasted perfectly fresh at the end of the three years.—*Amer. Jour. Pharmacy.*

To Prevent Explosions when Casting Lead.—The whole trouble may be stopped by putting a piece of roein, ahout the size of a hickory nnt, into the ladle and allowing it to melt hefore pouring.

To purify rancid butter, work it up with a solution of hi-carbate of soda, chloride of sodium, sugar and tartaric acid. A patent has heen taken out for the process, which it ie claimed will restore the moet rancid hutter.

Starch soaked for a year in a cold saturated solution of common ealt is gradually converted into glucose.

How to Grind Edge Tools.

Edge tools are fitted up hy grinding. The sharp grit of the grindstons, being harder than the iron or steel, euts vsry small channels in the surfaco of ths metal, and the revolving disk carries away all ths minnte particles that are detached hy the grit. If ws were to examine the surface of tbe tool that has just hssu removed from ths grindstone nnder the lens of a powerful microscope, it would appear, as it were, like the rongh surface of a field which has recently been scarified with some implement which formed alternats ridges and furrows. Hence, as thess ridges and furrows ruu together from hoth sides at the cnttiug edge, the newly ground edge seems to hs formed of a system of minnts testh, rather than to consist of a smooth edge. For this reason a tool is first ground on a coarss stone, so as to wsar the surfacs of tbc steel away rapidly; thsn it is polished on a wheel of much finar grit; and finally, in order to reduce the serrature as much as possihls, a whetstons of ths finest grit must be employed. This gives a cutting edge having the smallest possihlc serration. A razor, for example, does not have a perfect cutting edge, as one may perccive hy viewing it through a microscope. Beginners are sometimes instructed, when grinding edge tools, to havs the stone rsvolve toward the cutting edge, and sometimes from it. When the first griuding is heing done, it is a matter of indifference whsther this is done or not; hut when the finishing touches are applied near and at the very edge, a grinder can always complete his task with more accuracy if the periphery of the grindstone revolves toward the cutting edge, as the steel that is worn away will be removed more easily; whereas, when a etone runs in the oppoeite direction, the grinder can not always tell exactly when the side of the tool is fully ground up to the edge. This is more especially true when the steel has a rather low or soft temper. The stone, when running from the edge, will not sweep away every particle of the metal that hangs as a "feather;" hut when the stone revolvee toward the edge, there will he no "feather edge" to deceive the eye of the grinder.—*Cassell's Household Guide.*

Bananas as a material for the manufactnre of alcohol are proposed. It is said that their great cheapness in conntries where tbey are grown and their richness in sugar eminently fit them for this purpose, and that a profitable investment of capital wonld be fonnd in the establishment of alcohol dietilleries in Venezuela and other lands where this fruit is grown in ahundance. Experiments in the manufacture of sugar from the fruit have proved unsuccessfnl. The pulp of the hanana contains, according to analysie of MM. Marcano and Muntz, 8.5% of cane sugar, and 6.4% of grape sugar.

Cement for Cast Iron.—Five parts of sulphur, two parts of graphite, and two parts of fine iron filings are melted together, taking care that the sulphur does not catch fire. The parts, previously warmed, are covered with the cement, reduced to a pasty consistence on a fire, and firmly pressed together. Thie cement, it is said, is very well adapted to fill out leaks in cast iron vessels.

Corks are made both air-tight and water-tight if plunged in melted paraffine, aud kept there for about five miuutes. Thus prepared, they can he easily cut and bored, and may be inserted in, or withdrawn from, hottles witbout any difficulty.

To Clean Silk.—A teaspoonful of powdered horax dissolved in one quart of tepid water is good for cleaning old black dress of silk, cashmere or alpaca.

Good Health.

Worth Remembering.

1. Child two years old has an attack of croup at night. Doctor at a distance. What is to be done?

The ohild should be immediately undressed and put in a warm bath. Then give an emetic composed of one part of antimony wine to two of ipecac. The dose is a teaspoonful. If the antimony is not handy, give warm water, mustard and water, or any other simple emetic; dry the child and wrap it carefully in a warm blanket.

2. Some one's nose bleeds and cannot be etopped.

Take a plug of lint, moisten, dip in equal parts of powdered alum and gum arahic and inseert in the nose. Bathe the forehead in cold water.

3. Child eats a piece of bread on which arsenic has been spread for killing rats.

Give plenty of warm water, new milk in large quantities, gruel and linseed tea; foment the howels. Scrape iron rust off anything, mix with warm water and give in large draughts frequently. Never give large drafts of fluids until those given before have been vomited, hecause the etomach will not contract properly if filled, and the ohject is to get rid of the poison as quickly as possihle.

4. A young lady site in a draft and comes heme with a had sore throat.

Wrap flannel around the throat, keeping out of draft and sudden changes of atmosphere, and every half hour take a pinch of chloride of potash, place it on the tongue and allow it to dissolve in the mouth.

5. Child falls hackwards in a tub of water and is much scalded.

Carsfully undress the child, lay it on a hed, on its hreast if the back is scalded; bs surs all drafts ars excluded; thsn dust ovsr the parts scalded with bi-carhonate of soda; lay muslin ovcr it; then make a tent by placing two hoxes with a board ovcr them in ths bed, to prevent the covering from pressing on the scald; cover up warmly.

Mower cuts driver's legs as he is thrown from seat. Put a tight handags around the limb ahove the cut, slip a cork nndsr it in the direction of a line drawn from ths inner part of the knee to a little outside of the groin. Draw the edges of the cut together with sticking plaster.

6. Child has a bad earache. Dip a plug of cotton wool in olive oil, warm it and place it in the ear. Wrap up ths head aud keep it out of drafts.

A Word to Insurance Officers.—The *Plumber and Sanitary Engineer* suggests to life insurance companies, that instead of marsly hammering at a man's chest to find if he has a tendency to any disease, would it not hs well for the medical sxaminers of lifs insurancs companies to inquire if he has not got a cesspool leaking into his well, or untrappsd pipes beneath his hasins and closets? More persons die of zymotic diseases in New York than from almost any other malady, yst a man living in tbe midst of contagious influences, and hence daily liable to take diphtheria or typhoid fever, would yet find little trouble in getting a heavy policy on his life. If insurance officers would give this suhject their attention they might save many losses to their companies, and also henefit the public generally; for if men found that their homes were rated as "hazardous," they would eoon hegin to think of finding a remedy for the difficulty.

Alum in Bread.—Alum is sometimes used by bakers to make a good-looking loaf from an inferior quality of flour. The danger to health of using it freely has often heen adverted to, and we notice that an eminent English medical authority says that the general use of alum hy hakers is one of the most fertile causes of dyepepsia, liver and bowel complaints in adults, and of debility and rickets in children. Bad teeth and their early decay is another consequence of the daily use of alum in food. It is claimed by physiologists that when there is alum in flour, the bone matter of the bread (phosphate of lime) instead of becoming assimilated by the syetem, is either wholly or in part converted into a salt of alumina, which is useless and incapable of appropriation.

Treatment for Distemper.—It will be interesting to lovers of the canine species to hear of a simple remedy for distemper. At the quarterly meeting of the Scottish Metropolitan Veterinary Medical Society Mr. Baird mentioned the case of a colly dog in the last etage of the disease, and which its owner had determined to destroy. Shortly after being treated with dosee of strong coffee and a little sweet milk, the animal, however, so far recovered as to he ahle to etand and walk. The chairman of the meeting said the case seemed almost unique. —*London Lancet.*

Mr. Robert Rawlinson, in a paper on "Sanitary Science," says: "As the strength of a nation is in the health of the people, it must he the duty of governments to see that means of health are secured to every child born into the world. There is no value apart from human life, and as the poor cannot provide their own dwelling-places, and as experience from the first dawn of history proves that defective tenements produce disease in excess, it must he a prime duty of a government so to legislate, order and regulate that health ehall be possible within the cottage."

A Cure for Poison Oak.—Now that tbe picnic season attracts thousands of people into the country, we reprint tbe following cure for "oak poison," which several persons claim to have used with complete euccess: Dilute sweet spirits of niter with the same quantity of cold water; apply with a white cloth every ten minutes until cured. When of a few houre' contraction it seldom requires more than one application.

Ozone in Relation to Health.—Heretofore ozone has been considered highly conducive to health—that it is an exceedingly healthful principle in the atmosphere, but several scientists have recently taken the opposite view, and seem to he revealing facts which are heginning to startle those who helieve ozone and "ozonized" articles of food or of medicine are quite universally beneficial.

Eucalyptus for Cold in the Head.—A European writer asserts that acute coryza, or cold in the head, is cured in half an hour hy chewiug the leaf of the eucalyptus and slowly swallowing the saliva. Its action is douhtlessly similar to that of cuhehs, which will produce the same effect.

The Empress of Germany offers an international prize for the hest treatise tending to facilitate the cure of diphtheria.

On Certain Much-Abused Mollusks.

[By Robert E. C. Stearns.]

In Victor Hugo's very popular novel, *"Les Travailleurs de la Mer,"* the domain of nature being either stale or insufficient, the enterprising author manufactured a new species, a monstrosity, which he invested with characters belonging to widely separate forms of animal structure. If a hibernicism is permissible, it may be said that he *describes a nondescript*, mixing in an incongruous jumble unrelated peculiarities of different divisions of the animal kingdom.

The average novel reader whose appetite is aroused by the motion or activity of the narrative, and whose interest is retained by the momeutum as well as hy the glamour of Hugo's percussive and explosive verbal pyrotecbny, it may be presumed is not sufficiently well informed iu such matters either to notice, or he offended hy, euch trivial crimes against nature.

Hugo connected his invention with the cuttlefishes by calling it *"la pieuvre,"* whicb is the provincial or local name among the fishermen of the Channel Islands for the eight-footed cuttles (Octopoda) of the region, the "Poulpe" of French authors. Herein liee his offense.

As, soon after the appearance of thie hook, Mr. H. Crosse, one of the intelligent and ahle editore of the *Journal de Conchyliologie* (April, 1866), under the title of "Un Mollusque hien maltraite,"* pointed out Hugo's numerous aheurdities and special inaccuracies, there ie no necessity for indicating them again; but as we have to notice other sins of a similar nature, if less heinous, by other sinners, it may he well to quote in part the concluding portion, of Mr. Crosse'e justifiahle and pertinent criticism:

"It is * * * the duty of those who have * * * devoted their lives to the study of science to point out and rectify euch gross errors, much more dangerous when they emanate from so eminent a writer ae M. Victor Hugo than if they came from an obscure author. We must add that, though this unlucky chapter is full of every kind of enormity and of facts absolutely false as to science, the paper of Paris which has the largest circulation, although not the moet intelligent, has especially selected it as a specimen of tbe work, and transcribed it at full length with the most fulsome eulogies."

M. Crosse, in closing, ironically adds:

"We see therehy that the instruction of tbe masses in the natural sciencee is in good hands and well directed. M. Michelet, also a confused *litterateur* in regard to science, had already drawn quite an amusing and fanciful portrait of tbe *Poulpe;* but after that sketched by Victor Hugo nothing more can he added. It is easy enough to make it more accurate; but to frame it more fantastically would be almost an impossibility."

In the *Popular Science Monthly* for January of the current year (p. 345), we have a paper on "The Devil-fish and its Relatives," a chapter from a book† in press at the time, in which Hugo's sensational name is adopted, and either for padding or piquancy, perhaps hoth, a part of his "terrihly vivid description" is quoted. The writer adds, as a mild qualificatiou, "Though incorrect in several scientific details, the description is the best we have had, though Jules Verne's is almost as dramatic and nearer to Nature."

The title, and the foregoing extract, brief thongh it be, is sufficient to iudicate to tbe scientific student or intelligent reader the quality of the article aud the probable character of the book. If Verne's "general description" had been a little more dramatic and a little further from Nature, we may aseume that the author would have quoted him instead of Hugo! On a succeeding page (347) we are presented with a sensational picture, "Fig. 2. The Giant Squid," in the great double and daring act ae the circus folk would express it, of clasping a square-ended skiff or boat, while at the same time this devilish fishy "Giant Squid," uot satisfied with stealing the man's boat, is actually "going for" the man himself, aud had, up to the last time that we look at the picture, already wound or twisted *three* arms around the man's *two* legs. Such deliherately cruel conduct on the part of this "Giant Squid" indicates that "The Devil-fish and its Relative" are cold-blooded animals, a fact of phyeiological importance; so inferentially we get an occasional chunk of knowledge to pay ue for the time expended. We left the poor man (perhaps a legal voter) in a precarious eituation, probably getting ready to "he *drunk* alive." The picture indicates that drunkenness in some of its forms was prevalent at the time it was made, for the proportions of this particularly malicious "devil-fish" are not those of any known species, while to point the *tail* (if not the moral) the conventional devil's tail of the "old mastere" is grafted on or in this unique form, in a way to produce a startling effect on weak nerves.

Will the author please inform us what particular species of cuttlefish is represented in the figure? It is undoubtedly a new form! The disproportionately small size of the fins (or tail), the peculiar form of the same and mode of attachment, prove this to he a new, distinct, and rare species. Is it an octopod or a decapod? Though called a "squid," which would warrant the assumption that it has ten arms, only seven are visihle; however, the rest may be in the second cabin! As no one has ever seen a cephaloped huilt on such a model, with the posterior portion of the hody tapering and attenuated to a point, witb a heart-shaped tail stuck on it, suggesting a whaler's bomb-lance, we are forced to the conclusion that Mr. Damon has discovered a new species, which he had better describe, ere the man in the skiff "is *drunk* alive." Before this, however, he should copyright the picture, and get a patent for the tail! On page 349 we are informed that "According to scientific claseification, the octopus helongs to the division of soft-bodied *Mollusca*, and the class of *Cephalopoda*—meaning 'feet proceeding from the head.'" Is there a division of hard-hodied mollusca, and do the decapods helong to it? Again, we are informed, "Of the Octopoda family is the small paper nautilus or argonaut. How few of our readers who have admired this heautiful shell, *with its mother-of-pearl lining*" (italics are oure), "have realized that its former inhahitant was own cousin to the borrihle devil-fish." Oh, my! there he goes again, and "poor but respectahle" Mrs. Argonaut is defamed and charged indirectly with heing a relative to, if not *particeps criminis* with, that apochryphal devil-fish of Hugo'e. The *mother-of-pearl lining* in an argonaut shell is eomething new. Mr. Damon has invented another epecies, or else he is ignorant of what he has written ahout. Produce your pearly-lined argonaut, and the dealers and conchological *dilletanti* of Europe aud America will purchase all your epecimene at fancy prices.

Tryon, at the closc of his general remarks on the *Cephalopoda*, in his Manual of Conchology, referring to this paper, misquotes the title, hut says, "Those who prefer modern marvels will find in it a choice assortment."

If such be popular ecience, the less of it the better.

In *Harper's Magazine* for Fehruary, we have a profusely illustrated article, entitled, "The Treasures of the Deep," in which the artist has done grievous wrong to certain helpless mollusks by making eeveral right-handed or dextral forms, left-handed or einistral, as may he seen hy turning to page 329, the upper group, which includes what the author calls "Venue' Comh" (*Murex tenuispina* of Lamarck); the second form covered with tuhercles known to naturalists as *Murex haustellum* of Linnæus; also the cone-shell *C. nobilis*, the top-shell *Trochus niloticus*, and the ehuttle-shell *Ovula* (*Volva*) *volva*, (not *Ovalum valva*, ae printed), are all thus misreprcsented.

Wbile certain species of Mollusca—marine, fluviatile and terrestrial—are einistral, the great majority are dextral or right-handed. A few species iu each of the three divisions are hoth dextral and sinietral, hut the forms referred to above are always dextral.

As the author, on page 331, compliments "the accomplished artists who engraved these shells and the cut of the nautilus," (more properly *Argonaut*), we may infer that the draughteman is to hlame for these perversions.

Ianthina communis, the violet snail, appears as *Ianthana*, and the author's idea of nacre is not quite lucent, when he tells us the epindle-shell is "pearly white," and eo one gets bit by bit, a scrap of information, until finally the scrap is reduced to a crumb, and the last crumb which we will refer to is that "*Spondylus regius* is prohahly the rarest ehell in the sea," and Dr. Chenu's old etory about the learned professor who sold his "wife's jewelry and silver spoons to purchase one of these rare specimens," is resurrected, et cetera, to point a moral or to give, as in a previous case, piquancy and padding to the prosy text.

Without guessing at the weight of the paper, we may pass on with the remark, that it is essentially light reading; from pearls to ivory may do, but from Cleopatra to Walrusses we fear will be regarded by readers of classical proclivities, as a new form of that old "step from the sublime to the ridiculous." Mark Antony, Esq., heing deceased, it is probable his feelings will not be hurt; were he around as formerly, he would certainly make it lively for the author. Readers of another class will probably detect a slight top-dressing of diluted popular science.

In pursuance of the practical advice given elsewhere to Mr. Damon in relation to his pearly argonaut, we would euggest that the creator of the sinistral monetrosities, figured in *Harper's*, ehould at once dispose of his precious specimene to the museums, where the curious, whether scientific or otherwise, may see them. They would command high prices, being undoubtedly unique.

From the monthliee to Webster'e big dictionary* may be regarded as passing from gay to grave, from lively to eeverc.

Next to the Bihle and Koran, mighty in all its massy corpulence and ponderous dignity, comes the big dictionary! The solemnity of its physiognomy is awful! In some portions of even Christian countries, where the Bihle—alas!—is little used, or only a small-sized edition is accessible, witnesses are sworn upon this portly tome. Next in potency to a rooster to force the unwilling Mongolian to the truth, comes the big dictionary, with the mysterious power of its accumulated and concentrated wisdom.

Within the covers of this awe-inspiring volume we might expect to find ample, unabridged, and impartial justice. No! Even here certain defenseless mollusks are the victims of pictorial infelicitiee and left-handed compliments.

The *Cephalopods*, so cruelly used hy the otbers, are again badly treated. The definition of the word *Cephalopod* is well enough so far as it goes, hut for a figure we are presented witb the shell of an *Ammonite*. Upon consideration of the fact that the *Ammonites* are an extinct form, without a living representative for uumberless centuries, and that the present seas of the globe contain numerous living species and multitudes of individuals of *Cephalopods*,* and that the figure given is wholly irrelevant to the definition; and that while the Ammonites were or are Cephalopods, the latter are hy no means *Ammonites* any more than a horse is a mare, the absurdity of the foregoing is at once apparent. While the Ammonite and the Cuttle-fish are properly figured, the unfortunate Cephalopods are needlessly humiliated!

To illustrate the family of *Entomostomata* we have two figures, viz.: 1. *Ricinula horrida;* 2. *Cancillaria reticulata*. It will he noted that the generic name in the latter is misspelt; it should he *Cancellaria*, as the cancellated sculpture of the ehells suggested the generic name. Both of these well-known dextral or right-handed shells are figured as einistral; they are also presented apex down. When the actual shells are held in the proper position, with the apex up, it will he seen that the mouth, as the opening is called, opens on the right-hand eide.

Helix (4 Zool.), the snail ehell, is represented hy a reversed *Bulimus* or *Partula*. We should naturally expect to find a typical Helix as figured by some of the old authors, say *H. pomatia*, the snail of the Romau epicures, or *H. aspersa*, also an edible species, largely used in Europe hoth in ancient and modern times.

Melania aurita (see Melaniau), a dextral shell ie made einistral in the wood-cut, and nothiug ie said as to whether this numerous and widely distrihuted form is marine, fluviatile, or terrestrial.

For *Nautilus* we have a figure *Argonauta arg* (shell and animal) as stated; while the Argonauta is frequently called the "paper nautilus," the true nautilus shell is internally chamhered ae stated in the accompauying definition, and is also nacreous or pearly, while the shell of the *Argonaut* is neither chamhered nor pearly. The absurdity of the figure in this connection is made more conspicuous by the note which follows the definition.

Again, it is rather curious that while unde the definition of *Mollusk* there is given in the group of figures those of a recent *cephalopod*, a well as the true *Nautilus*, animal and shell (th latter in section, so as to show the chambers) also a *Helix*, animal and shell—that such inappropriate figures, to say the least, should have been placed against each of the ahove words, a hefore shown. As to the definition of *Nautilus* it ehould he said that the shell is not spiral, hu involute and discoidal. The definition of *Paludina*, tbough brief, is well euough; but the figure of *P. vivipara*, as given, is sinistral, aud the mouth, wbich in nature is simple, round, and continuous, is made with a thickened and reflexed peristome.

For Periwinkle we are furnished with what i intended as a portrait of *Littorina littorea*, a stated in the definition (1 Zool.); a dextral shel between tide-marks, hut sinistral, with it mouth ou the wrong side, when found iusi the covers or on the dry land of the diction The large and showy shell, *Triton* (Trit now), always dextral, is represented by *T tonis* iu the reversed figure. The same made to do a double duty, like the drawers in Goldsmith's "Descrted For opposite the term *Trumpet* eide" is placed uppermost, and we it is "a univalvular shell of the pet, a species of *Buccinum*." neither satisfactory as to the nor in the statement of its tions. The ancient sculpt the shell in the hands of tons, for whom the ehel are generally represent lips, blowing the shel the natives of some as a war trumpet. chology, some of geueral form wi since been rem

Against the cies of shell of tion, figured as s nection it makes tral form illustratiu dextral; but not only *Marmoratus*), hut all o are dextral shells. Th illustrated by a species of tached to it ie "Buccinum different form.

Scalaria, always a dextral though sinietral in the dictionary, by the common European *S. co* popular name for the general for *trap*. On turning to this word, which is given, a poor sinistra large Indo-Pacific species, *Scu* presented for this well-kno Even the common form *Strom* ehells, eome species of which dant, hence frequently met collections, and alwaye dex hy a left-handed figure.

Vertigo (2 Zool.). Defi gasteropodous mollusca wit form shell." Upon turning to *fusiform*, derived from *fusus*, a spindle, we find the tion to he "shaped like a spindle, tapering end." The definition is the same as conchology. It does not apply to the Vertigo, which are small, stumpy spiral shells, some species heing sinis others dextral, with curiously twisted months.

We will not at this time prolong into the conchological or malacologi of this, that, or the other big diction though it may he to point out the man side in so pretentioue a por more painful still to think of its those helpless forms, which hav protect them, and which are al hy the various societies for th cruelty to animals! And her with these appropriate lines fro might have heen written for t

t of Industrial Success.

joyed reading an articlo hy an sh economist, in a leadiug Ameri- n which great problems of success u a world's trade and industry wers As we proceeded through ths reful analysis of industrial couditions great nations, and drew therefrom ns pointing to ths causes of stagnation ression, we were struck more forcibly r hsfore with the fact that success, and ns of its attainment, are essentially ths whother it be the success of an individual, nation with a population of mauy mil- There is no discovery in this position; ld as it is trus; and yet we ars too prons k upon national prosperity as something lly unlike that of an individual—as a grand from some highsr powsr, and not as a con- ion of affairs affected by the sams class of usss and influencss as those which shape our n lifs successes. And yet thus it is: the ruths of political economy liks other great ruths cover alike the great and ths small in life and action, and hring us to hardship or pros- perity according to our deeds.

It is not our purpose to follow tbe writer in his outline of causes producing the depression which has been felt all over the civilized world. Rather would we take ths hint which the writ- ing implies and draw from general and wide- reaching causes soms special lessons for in- dividual adoption. It is shown that each of the great nations, which are now struggling undsr depressed trads and unrequited industry, bas, during recent years, undertaken some wild and unwise line of expenditure which has been greatsr in cost than the surplus earnings of the country, and has trenchsd upon fixed capital in some manner. Relying upon marks of unusual prosperity, nations have pusbed forward extrav- agant schemes which soou leaped beyond tbe limits of surplus earuings and beyond imme-

OF SAN XAVIER DEL BAC, NEAR TUCSON, ARIZONA.

diate productive needs, and thus have burdens settled down heavily upon the people, repress- ing trads and checking industry. How like the history of many individuals is this chapter from ths life of nations? How many instances do we see on all sides wbere men havs refused to make their actual surpluses some measurs of their new ventures, but rather bavs yieldsd full adherence to enterprises and projects which gratified their fancies or hlinded them with ths illusive hope of some grsat and speedy aggrandizement. Following these splendid visions of easy fortunes hy fortunate stroke rathsr than hy husbanding of labor's rewards, they have horrowed from every lender, and, as their air castles vanished, they find themselvss laden with great weights which they can only dischargs by return to ths old pathway of diligent lahor and self-denying economy. It is a weary work, after one has fed on fancies and dreamcd of no lahor but tbs waving of a magical wand, to return to the toil of the plow, the sledge, or even to the tiring monotony of merchandising. And yet the rs- turn must hs made, and bappy is hs who soonest takss the hint. For years we have besu living in an atmosphere of veuture and great uudcr- takings. Thus our whols industrial life has been tingcd more or less with refracted light, and not illumined with the clear white gleam of labor and its rewards. During the last few years we have been suffering from the collapse of great hollow ideas which inflated our hrains until our skulls seemed nigh to bursting. Now the wrecks of industrial fallacies seem to be clearing away before the returning tide of truth, and there is hope for the return of the good and enduring prosperity of earlier days.

The world's history is a long tribute to the virtaes of industry aud economy, and a warn- ing agaiust their opposites. The experience of this last era when it shall be written, will but strengthen the old truth. It will point the true course to nations and to individuals. It is a hopeful sign for the future of California's in- dustries that the lesson is heing widely learned. The arts of production were never more closely studied than now, for it ie a vital point that wastes shall be stopped and effective work pro- moted. Lst our industries now have their proper place in the minds of ths people. Let the deluding thrall of specious schemes pass away. Let us coms down to the soil, the min- eral, ths metal, assured that though the steps be hard aud the progress slow, ws are in the true path which will lead ns away from the dehris of exploded fallacies into the free open field of houest effort and temperats living. By this sign ws shall conquer; and California will sre long he known, not as the land of great illu- sions, but as ths home of a labor-loving, economi- cal and prosperous people—a land living no longer in the memory of an illustrious past, hut in the realization of a more glorious present, and cherishing the hope of a futurs beyoud anything ws now can know.

* "The Stagnation of Trade, and its Cause," by Prof Bonamy Price, in *North American Review* for June.

Eastern Money and Western Mines.

In so far as such fact can hs supposed to have any significance, ths adoption of a new Consti- tution by ths people of California has not de- terred Eastern capitalists from invssting in our mines. Hardly ever has the business of bny- ing, bonding or otherwise dsaling in these prop- erties heen more active than of late. There is, ns we well know, much idls capital in eastward lying countries. The monsy repositories thsro are repletc with unemployed funds. Investors are casting about for ventures that promise security coupled with a fairly profitable issue. They regard our gold aud silver mines with favor. But thcir sxperience in the mines of the far west has not always been happy. They havs now and again met with financial reverses off this way. So they havs grown a little more chary than at first. They are willing to embark their means freely in mining, hut thsy insist on having properties of merit in rcturn, and in this requirement ws trust there will be no letting up. On this point we hops they will show themselves exacting—inexorable. There are plenty of first-class mines in this country for sals at moderats prices. It is just as easy to obtain a good ons as a poor oue, of wbicb lattsr thers have been too many already palmed off on ths Eastern public.

Among receut transactions of really sterling properties, ws note the sale of ths Taylor Flat hydraulic mines with water franchise, etc., to moneyed men in Indianapolis, United Statss Treasurer New, being ons of the two or three purchasers. This property is situated in Trinity county and is highly spoken of by those acquainted with it. The Buckeye water and hydraulic company, owners of extsnsivs gold- bsaring gravel lands, ditches, water rights, etc., also in Trinity, havs just obtaiued in ths East the large sum of money necessary for extend- ing their main ditch to its principal source of water supply, for finishing the long hedrock tunnel now in progress and otherwiss putting their grounds in good shape for the hsavy and profitable production that awaits a resumption of operations.

Samuel Leet, of Oakland, bas just completsd the sale of a large hydraulic property located on the Forest Hill divide, Placer county, for the sum of half a million dollars, one-fifth of which has been paid down. The buyers resids in the East and bave mads a good purchase. The gravel here is of sxcellsnt quality and great depth. The mins has been opened and equipped, has ample outlst, water supply, etc. The Ward silvsr mine, in the Reese River country, has also changed hands of late, and will hs worked hy Eastern capital. This mine, which liss in ths rich mineral belt that has given distinction to Lander Hill, has a singular history. Having been located at the tims of ths Rsess River ex- citement, it was considered for a while one of the most promising properties in that locality, the croppings carrying ors of an exceeding high grads. These rich surface deposits having bsen hurriedly worked out, the locators abandonsd the claim, which was neglected until recently, when a miner named Thomas Ward took it up, had it recorded and went to work upon it. Aftsr sinking hut a short distance the rich ors cams in again, and following it, the owner, who had not a dollar at the start, has since taksn out enough ore to make him a tolerably rich man. The last lot of ore extracted by him, amounting to 232 tons, yielded at the Man- hattan mill a gross product of $104,000, being an average of more than $400 per ton. The ore hody is shaping for a large deposit, and this is now rsgarded the most promising property on Lander Hill. The new owners havs commenced a deep exploratory and working shaft, and taken other steps looking to systematic and thorough development as well as the extensive benefici- ating of the ores, sucb as the erection of hoisting works, mills, furnaces, etc.

We hear of many other similar sales to par- ties abroad, the details of which we will take pains to collect for early publication, and which tend to show that confidence in the value of mining properties on this coast has not of late suffered impairment in the estimation of Eastern investors. Not only in the purchase of miuing properties does this well-sustained con- fideuce manifest itself, hut also in the purchase of mining shares, many of the orders for which come from the East. Heavy deposits on East- ern account have also been made in our city hanks, these funds to be dishursed in purchase of mining stocks. The shares of several of our more prominent mines, such as the Standard, Bulwer, Bodie, etc., nre meeting with large sale at the New York mining board, wh[illegible] ey [illegible] not only well re[illegible]ived, h[illegible] to [illegible] favorite.

The Week.

The steadily-increasing excitement in mining shares, the continued encouraging reports of new and extensive finds, and the hustle attendant on the cleaning up and closing down of so many mines for the season, is awakening redoubled interest in the work, and casting a brighter and more encouraging glow over the whole field of mining interests. In California, Inyo reports fine prospects in the Modoc, and speaks an encouraging word for the once famous Panamint mines; Bodie district is rising in favor so fast that her developments cannot keep pace with the inflation; Nevada and Placer are closing up as necessity compels, and the sound of their picks is gradually giving way to the chink of their bullion. Siskiyou is coming bravely to the front as a mineral producer, and prospectors are largely flocking in upon her.

From Nevada we have the same old promise held out of "splendid indications" in the Comstocks, but as yet we fail to grasp the reality. Oregon is blessed with a new lease of life in the abundance of her recent rains. Conflicting reports come to us from Idaho as to the real value, the actual worth, of the Snake River and other placers. The newspaper factions are about equally divided on the question, one side being bitterly denunciatory and the other as loud in their praise. Evidently these are not "poor-men's" mines, for without use of the costly "plate" machines no profit whatever is obtainable. This may explain the controversy. In Colorado the still discouraging reports from Leadville are more than balanced by the brilliant outlook at Silver Cliff and Ten Mile. Finally, Utah has severely suffered in the destruction of Silver Reef by fire.

THE promised discoveries in electric light seem not to have alarmed the holders of London gas stocks, shares in which have not greatly depreciated nor changed hands of late.

The Robertson Process.

The Robertson process is the latest aspirant for public favor in the metallurgical lins, and is now attracting greet attention, as all such things do at first. Many persons bslisvs in it thoroughly, and think it destined to "create a revolution in the processes of ore reduction," a conventional phrase which has been applied to every process yet attempted which gave ths slightest signs of success. Others again say there is nothing in it whatever; that it does not do what is claimed for it; and that in six months it will only be classed with the numerous failures in the same line of which so many have been chronicled. In order that our readers may know exactly what Mr. Rohertson claims for his process, we give a copy of ths patent, which is worded as follows:

The object of my invention is to perform in a single operation what has required two or three operations, and much time to effect in the process of extracting precious metale from rebellious ores—that is to say, hy thoroughly desulphurizing the ore and bringing the precious metal to a condition to amalgamate freely, aggregating the same, and freeing it entirely from the influence and union with the base metals.

To effect this object I place a vat or receiver of sufficient capacity to hold the ore of the most convenient quantity for a single operation—say one ton—and immerse the same in a quantity of water sufficient to cover it. The required quantity of salt to make a thick brine, or as much as can he held in eolutiou with the same, is then used, adding thereto ahout one-half pound of cyanide of potassium and one-half pound of sulphate of copper, forming a eolution of salt and cyanide of potaseium in the ahove described manner. The ton or other desired quantity of ore is slowly heated to a red heat, and afterward plunged, while red-hot, into the aforesaid solution, the ore being broken up to ahout the same size that it is broken for milling. By hringing the ore in contact with the solution it becomes thoroughly desulphurized.

The entire operation of desulphurizing and disintegrating the quartz and sulphurets is almost instantaneous.

Iron pyrites and sulphurets generally are reduced to a very fine flour or almost impalpahle powder, and the quartz is disintegrated, that it may he readily picked to pieces with the hands, and requires so little ruhbing that it may he readily prepared for amalgamation in an ordinary amalgamating-pan.

The action of the cyanide of potassium, in connection with the sulphate of copper, cleans, hrightens, and immediately prepares the precious metals, for amalgamation with the quicksilver, no matter how fine and impalpable the same may be.

The solution composed of the ahove ingredients, and the manner of treating the ore previous to its being brought in coutact with the same, render the operation of extracting the precious metals from the ore very eimple and effectual, and accomplisb it in a very short time.

The claim allowed by the Patent Office on the process is as follows:

"The process of separating precious metals from the ore by heating the ore to a red heat, and afterward plunging it into a solution of salt, sulphate of copper and cyanide of potassium in ahout the proportions set forth."

There is nothing particularly new in this process except the plunging of the heated ore into the *special* solution named. If heated and plunged into any other suitable solution the patent would be avoided. The dieintegration of rock by throwing it into water or throwing water upon it, is "as old as the hills." When Hannihal crossed the Alps, in the year 218 B. C., we are told by Livy and Polybius, that he "hlasted" his way through difficult passes, by building fires against tbe rocks and then throwing the acid lees or dregs of the soldiers' wine on the heated rocks, thus elacking or disintegrating them, repeating the operation until the passage wae formed. A patent was filed in the United States Patent Office in 1868, on the application and the use of the cyanidee in extracting gold and silver from their ores; and in the same patent there is a clause on the combination of mercury, salt and sulphate of copper. In 1864 a patent was obtained, in which the ore was reduced to a powder, preparatory to separating the metal hy subjecting it, as taken from the quarry, to the action of the heat long enough to drive off the sulphur, when it ie suddenly cooled, while, in a highly heated etate, by being let fall into a vessel containing water, or preferably dilute eulphuric or other acid, whereby it was caused to crack or crumble into atoms. The claims in the process were: 1. The process of treating ores consisting in heating, quenching, grinding and amalgamating. 2. Precipitating the heated ore directly from the kiln into a bath of acidulated liquid previous to the grinding operation.

Again, in 1865, a patent was granted in which ore was subjected to a high heat and then suddenly cooled in an alkaline solution. The ore was again then heated and cooled, and if not eufficiently disintegrated, the operation was repeated. The claim on this patent was, "1st., the application of treating rock or ores while in a heated state with an alkaline solution, for the purpose of partial disintegration, desnlphurization and oxidation of the same." The 2d claim was for re-treating to effect a *complete* disintegration, oxidatiou and desulphurization. Anothsr patent in the same year consists in heating the ore to a high degree and cooling it suddenly in a solution of selt and water, and repeating the process. The claim on this was "the application of treating rock or ores whils in a heated state with a saline solution, for the purpose of disintegration, desulphurization and oxidation of the same."

Other methods of a similar charactsr are described in hooks of refersnce, which we have not space to mention. An application for a patent was made by some gentlcmen in this city in 1874 for a process of reducing ores hy heating them to a red heat and while in that condition plnnging them into a solution of salt and cyanide of potassium. This application was rejected, no patent hsing allowed, as the Patent Offics saw nothing new in the process. Still, Rohertson does the same, simply adding sulphate of copper, and procures ths patent, as this particular solution had not heen patented for the purpose. The persons referred to filed caveats last yeer on an improved solution, and, we are informed, propose to sue Robertson for infringing on their rights. This is their own concern, however, and we know nothing of the merits of the controversy.

The use of salt, eulphate of copper and cyanide of potassium in working ores is common in various ways, and Robertson'e patent covers only his special way of treating the ores in the particular solution.

We simply cite the examples above given to show that the new procese ie not a radical change on those previously tried. Very few of these processes survive that infantile period in which only small samples of ore are treated. Fryer was to "create a revolution," hut didn't. The treatment of copper ores hy marsh gas worked in this city on a small scale, well; but after works costing $60,000 were put up a couple of years ago, the whole thing failed.

The Rohertson process has now reached the more crucial stage, when large quantities require to he treated, and which has eo generally proved fatal to this class of experiments. Having successfully managed the traditional pound of ore, it is now called upon to handle tons. That it cau do this the inventor claims, as some who have witnessed its operatione are prepared to admit. Others, however, and among them very competent judges, give it as their opinion that this process fails when tested on a large scale.

Since the above was written, Mr. Taylor, a miner and metallurgist of large experience and of good professional repute, is out in a letter to the *Alta*, wherein he gives the reeults of his examination into the merits of the Rohertson process, which he pronounces a failure. His statement is to the following purport:

Having sent one pound of Meadow Lake ore to Mr. Rohertson to he tested hy his process, he got a return of ahout $50 per ton, nearly all that was in it. Encouraged by this result, he took to Mr. Rohertson eeveral pounde of the same ore, to have it treated in his presence, which was done, the mode of procedure being essentially as we have described it in the patent. The ore was broken into walnut-sized pieces, heated in a common assay furnace, and dropped into the hath, which it was alleged destroyed all the base metal; all that remained to he doue being to pulverize tbe ore, when the gold would readily amalgamate.

Taking the eamples so treated, Mr. Taylor found it impossible to get from them even a trace of gold, the iron sulphurets remaining nearly in their natural condition. Being dissatisfied with this result, he wrote to Mr. Rohertson, asking him to give him an opportunity to test the process on a larger scale, but as this request received no attention, he concluded the inventor did not desire to have hie plan tried in the manner proposed. In the letter to the *Alta*, Mr. Taylor goee on to explain what he considere the defects of Robertson's method, and gives his own views as to the best methods of treating base ores. With this, however, we have nothing to do, our object being simply to describe the new (?) process, and those of similar character previonsly used.

Mr. Robertson has tested various lots of ores to the eatisfaction of the parties concerned, and those thus convinced of the efficacy of the process will, very properly, try it still further. As far ae the science of the process is concerned, it makes very little difference, provided the results accomplished are satisfactory; and all anyone could say concerning it would not convince those who had been successful with it, that the process was crude, unscientific and useless. Those, however, who have had no opportunity of eeeing ore worked under the proper conditions, in the presence of uninterested psrsons, will continue to doubt Mr. Rohertson'e ability to euccessfully beneficiate rebellious ores, nntil it is done on a eufficiently large scale and with a suitable class of oree, to remove it from the ranks of metallurgical experiments, and successfully placed heyond the reach of criticism.

MECHANICS' FAIR PRIZES.—The Board of Directore of the Mechanics' Institute met on Tuesday and decided that at their next fair, which is to open at the Mechanics' pavilion on the 5th of Angust next, but one prize would be given for the best general exhibit, and several cash prizes for the hest exhibition of flowers, fruits, vegetahles, etc. The season tickets will be of the same description as those used at the last exhibition.

The Manhattan Mine and Its Management.

Tbe holders of the Manhattan mining company's stock are hecoming restive under a policy that calls for assessments where dividends were promised, and, as is generally hslieved, ought to be paid. We have lately recsived a numher of letters, mostly from Eastern sbarsholders, making inquiry about this mine, its menagement, prospects, etc.; the writers explaining that they can get no reliable or at least satisfactory information from official sources. In answer to these inquiries we can only say our knowledge of this mine, its condition, prospects and conduct are general and indefinite, and not hy any means of that full and precise kind that these parties seem to requirs. Ths Manhatten mine, or rether mines, for the company own a numher of distinct lodes, is eituated at Austin, in the Reese River district, Lander county, Nevada. The lodes here, though very narrow and incased in granite, occupy regular fissures. They have a generally north and south trend, lie close together and for the most pert are very rich, the ores heing of the chloride variety ahove, with eulphuret or entimonial ores below the water line. Owing to the narrowness of the lodes, the hardness of tbe country rock and the high prices of lumber, ore extraction here as depth is reached hecomes rather costly. Ore reduction is also expensive, recourse to roasting heing necessary and fuel always dear. High prices, in fact, generally prevail here, the hulk of supplies including lumher, requiring to be imported, and the camp heing nearly a hundred miles from the railroad. Bullion cannot therefore he made as cheaply in this Reese River country as in many other parts of Nevada.

On the other hand, as hefore remarked, tbe ores about Austin are mostly of good quality, very little heing worked that contains hy assay less than $200 to the ton. Most of the ore treated mille that amount. For a series of years the ores handled hy the Manhattan company have yielded at about that rate. Despite heavy current expenditures their profits bave, therefore, heen large; so large, that for a long period they were enahled to and did pay liheral and uninterrupted dividends. Why these dividends have ceased and assessments been suhstituted in their place is not apparent to the outsider. The mines, for all the public knows to the contrary, continue to look well. We are informed of no vein pinching or exhaustion of the ore hodies. The same quantity of ore is being raised and milled now as aforetime, and we do not hear that the ores have grown more rebellious or suffered impoverishment. The legitimate outlaye of the company have not lately heen increased. Cost of lahor and supplies tends constantly to lower figures. The Manhattan management took occasion not long since to congratulate themselves on some savings effected through recourse to the trihute system for extracting their ores. Not rightly should outgoes be any larger with them now than they were last year or the year before. They ehould be less. Will they explain then how it ie that they are unable now to make net earnings, as formerly? We mean, explain this in a fair and satisfactory way, for the reasons assigned by them can hardly he accepted as either. If they have debts to pay, as they allege, when were these dehts created, and to whom, and for wbat are they due? And why were they not paid before the shares of the company were worked off on purchasers ignorant of their exietence? As for the discount on silver, that is no greater now nor yet so great as in timee past, and forms a very lame excuse for the present failure to make profits from tbe mine.

Are the directore of the Manhattan company quite sure that there is not eomething wrong about this business? Do they know as a matter of fact that there has not been a job put up here to deceive and swindle these complainants? Such things have been done before. The managers of these properties have a habit of engineering them into a prosperity that will enahle large holders to unload their ehares on the public at high figures, and then, through the levying of assessments, bring about such a decline in prices that these shares can be gathered in at mere nominal rates. As a suspicion of any such purpose on the part of these directors, even though nnfounded, would tend to damage their good names, they should hasten to explain just how it is that the Manhattan mine cannot now pay dividends as it did hefore, and more especially how this property, without having heen crippled in its productive capacities or otherwise undergone any deterioration, has heen converted from a self-sustaining, profit-earning institntion into a stipendary on the stockholders.

MINERAL RESOURCES OF JAPAN.—Deposite of petroleum have long been known to exist in Japan, but they were not, until recently, utilized, that people not being able to refine it. Having learned how to prepare it for burning, they have gone extensively into the business and will now be likely to make enough for their own use, thereby somewhat restricting the outlet for the American article. They have also started in to work their gold, eilver and copper mines, which for agee had been much neglected, though they are quite numerous aud with the aid of improved machinery and methods can probably be worked with profit.

Electricity vs. Gas.

A visit to the bnsy establishment nf Messrs. Goss & Adams, 114 Beale street, machinists nnd fonnders, mannfactnrers of the justly renowned "Corlise" engine, disclosed the fact that active preparatinns nre being made to lignt Kearny street by electricity. It was originally inteuded to use n 100-horse power Corliss engine, but now there is serious talk of increasing the capacity all the way from 100 to 500-horse power.

Mr. Adams can demonstrate clearly the oconomy in the nse of the Corliss engine, the saving being at least 12% over that of any nther engine nf the snme capscity. That it takes the lesd in all large manufactories in the Eastern States whore economy is sought, proves its clnima to be just.

Mr. A. states that he put a 300-horse power Corlisa engine in the Savags mino, which kept the water out and consumed nnly 17 cords of wood per day, while snother engine nf ths same capscity iu the same mine consumed from 30 to 40 cords of wood per day, and thcn could not keep the water down. The question of economy is an important one in electric manipulations.

A visit to the Western Electric Light Company nt 412 Market street, found Mr. W. H. Milliken tho engineer in charge. The Gramms machine and Siemens regulator will be nsed to gensrnte electricity. This cnmpany proposes to put 28 puhlio lights on Kearny strest, four to every block. The Jablochkoff light will be nsed — each one of which has a lighting capacity of 1,000 sperm candles—requiring one-horse power for every light. The Siemens regulator will require from four to six-horse power for every 6,000 and 12,000 candle light. Half ground globes, will he used in place of the objectionable opal globes used in Paris. Mr. Milliken declares tbat 10 cents wortb of labor and fuel will produce moro light by electricity than $3 expended in the same direction for gas. Milton S. Latham as President, J. Clem Uhler, Secretary, and S. D. Field, Superintendent of this company, give every assurance to tbe public that success will be attained. Mr. Latham is now in New York making final arrangements for generators, and is negotiating with Edison for the latest improvements.

Mr. Milliken is engaged in perfecting a means of storing electricity, an invention wbich will be made public as soon as the patent, already applied for, is granted.

Mineral Veins and Deposits.

Our attention baving been called to tbe reading of "A Contribution to tbe History of Mineral Veins," by John Artbur Phillips, before the Geological Society of London, at their very recent mesting, of tbs 30tb of April, 1879, we dssm it but fair to our local author, J. S. Phillips, to state that be has published and strennously endeavored to prove the same ideas in his 1st and 2d editions of the "Explorers', Miners' and Metallurgists' Companion" (a book of 672 octavo pages) more than nine years ago.

This author took especial pains to favor tbe idea, above all others, that the deep and consequently very hnt aqueous solutions brought up the minerals wbich were then deposited in the more shallow colder sections nf the veins; and in his 3d editiou, now being slowly passed throngh the press, be has named in the first part of the book, the *very places and facts* of the above contribution to the Geological Society.

Mr. J. S. Phillips is a close observer, and has professionally traveled tbrougbout this western region, as much as but few men, and in addition to the above statements, he also says: "There are *very many* warm springs in these several Western Statea of tbe United States of America, wbicb are depositing the matrices of silica, lime, magnesia, etc., witb small quantities of the ordinary commercial minerals;" and in another "foot note," he extends this notion even still further by saying: Before closing these chapters on mineral veins and deposits, I would record tbe following ideas, which may, some day, be more fully recognized and established:

"Organic matter, in decomposing condition, is generally present in silicic acid and other earthy solutions, which, wben passing down through the veins and pockets, may serve as the very important reagent for simultaneously releasing and precipitating tbe silicia, alumina, lime, potash, etc., with the gold, silver and base minerals upon the dualistic, lamellose aggregations of the veins, and in the above more irregular deposits; in a manner differing only from petrifactions, by tbe equally disseminated weak solutions of organic and inorganic elements, causing the cleaner and more regular quartz-like deposit."

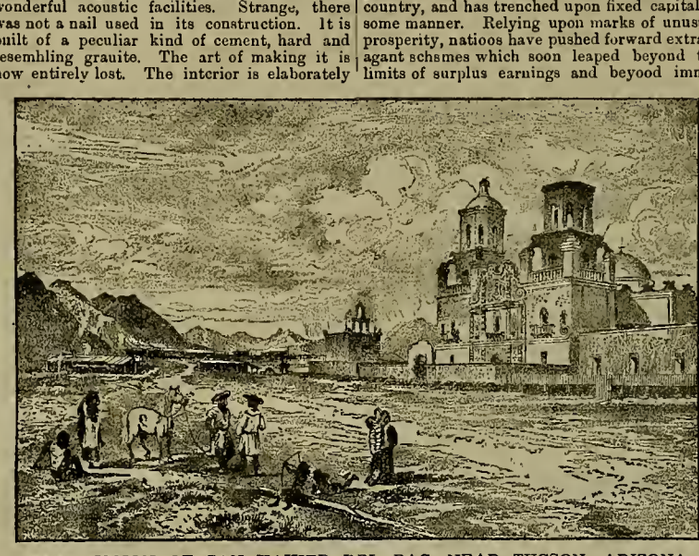
This 3d edition of Mr. Phillips' book is being now printed hy a firm immediately adjoining our own printing office, and we know that these remarks upon the properties named, and such ideas have beeu in print at least six months; and as regard the tbeories, the 1st and 2d editions of the book will show this and many other new theories for itself, and it has been largely circulated, not only here but in England and elsewnere.

Memorial Day was generally celebrated tbroughont the country.

San Xavier del Bac.

The engraving nn this page shows an nld Mission near nne of the oldest towns in the United States, Tucson, Arizona. This interesting relic of the zeal and enterprise of the pedres was photographed by Mr. E. Conklin, and an engraving from the photograph appenrs in his "Picturesqne Arizona," nublished by the "Continent Stereoscopic Co.," of New York city. The Mission is named San Xavier del Bac, snd although nearly 200 years nld, according to Mr. Conklin'a reckoning, it is still in a good state of pressrvatiou, and is npened for religious services to the nativcs, "a half-civilized remnant of a mixture of the Mexico-Indian blood." It is the best preserved Mission ruin in tho Territory, and is one of the boldest of its class in design snd most elaborate in construction. A recent visitor gives a description of the structure, which we reproduco to accompauy the engraving:

Nine miles distant from Tucson, down the vallsy, is the old Mission church of St. Francis Xavier, which is one nf ths greatest objects of interest in the country. It was built about 200 years ago by a community of Franciscans. Compared with a majority of these old churches, it is in a good state of preservation. One of the turrets is gone, but the belfry still stands, in which hang four or five bells in silver cadeuce; the others having been either carried away or stolen. You rcach the belfry by n narrow winding stair, bnilt in the solid wall, the steps worn into deep holes and depressions by ascending and desceudiog footsteps in ycars gone by. The church is cruciform, and is an immeuse edifice, with magnificent arches, nnd with really wonderful acoustic facilities. Strange, there was not a nail used in its construction. It is built of a peculiar kind of cement, hard and resemhling grauite. The art of making it is now entirely lost. The interior is elaborately



THE MISSION OF SAN XAVIER DEL BAC, NEAR TUCSON, ARIZONA.

ornamented; the paintings and colorings upon the walls are still vivid and hright, as though recently executed, and gorgeous in effect. Ths altar-piece and several other pictures are evidently the work of artists, but the others, which are numerous, were done hy pious but not artistic hands. At the end of the transept, high up, midway between the floor and ceiling, is the most ghastly spectacle imaginable. A cross of huge proportions is deeply imbedded in the wall, surrounded by rays of hlack, or dark brown and white. The body once extended upon it has either fallen or heen torn down, leaving one arm, lean and brown as that of a mummy, with bones protruding, nailed to the arm of the cross. It is a spectacle to make one shudder in spite of himself. There are still 75 life-like statues of apostles and saints left staodiug in their nichcs. Upon the faces of some of them the expression is marvelous. Some have fallen down, and otbers are mutilated by time or the irreverent. They all sbow skillful workmanship, and must have been brought by the fathers from Spain. The gilding over and above the main altar is still very heavy and rich. The main altar itself is covered with beaten virgin gold, taken by the monks or their Indian proselytes from tbe mines. The altar service, wbich is also of solid gold, was carried away a few years ago by some priests who came from Mexico for the purpose, and there are but two small vessels left to show what the other and larger pieces must have been. There are still some of the rich vestments left, hut their gorgeous texture is marred by long service and ahuse. The heavy doors are made of solid wood of great thickness, which is joined together in panels hy grooves. The large outer doors were not only made of thick timber, but were covered by tbick sheets of copper, procured from the mines and smelted hy the monks themselves, which, in conjunction with the enormous bar on the inside, make them impervious to any attack from their savage enemy. In connection with the church is the monastery or cloister, and within the surrounding inclosnre is the mortuary chapel—a huge sepulcher, where those who kept their vigils and toiled in a strange, inhospitable land to lead into the paths of peace the henighted nations, rest from their labors and are forgotten.

The Secret of Industrial Success.

We lately enjoyed reading an article by an eminent English economist, in n leading American review,* in which great problems nf success nnd failure in a world's trade and indnstry were discnssed. As we procesded through the writer's careful nnalysis of industrial conditions in all tho great nations, and drew therefrom cnnclusions pointing to ths causes of stagnation and depression, we were struck more forcibly than ever before with the fact that success, and the means of its attainment, are essentially the same, whether it be the success of an individual, or of a nation with a popnlation of many millions. There is no discovery in this position; it is nld as it is true; and yet we are too prone to look upon national prosperity as something wholly uulike that of an individual—as a grand gift from some higher power, and not as a conditiou of affairs affected by the same class of causes and influences as those which shape our own life successes. And yet thus it is: the truths of political ecouomy like othor great truths cover slike the great and the small in life and action, and bring us to hardship or prosperity according to our deeds.

It is not our purpose to follow the writer in his outline of canses producing the depression which has been felt all over the civilized world. Rather would we take the hint which the writing implies and draw from general aud wide-reachiug causes some special lessons for individual adoption. It is shown that each of the great nations, wbich are now struggling under depressed trade and unrequited industry, has, during recent years, undertaksn some wild and unwise line of expenditurs which has been greater in cost than the surplus earnings of the country, and has trenched upon fixed capital in some manner. Relying upon marks of unusual prosperity, natioos have pushed forward extravagant schsmes which soon leaped beyond the limits of surplus earnings and beyood immediate productive needs, and thus have burdens settled down heavily upon the people, repressing trade and checking industry. How like the history of many individuals is this chapter from the life of nations? How many instauces do we see on all sides wbere men have refused to make thoir actual surpluses some measure of their new ventures, but rather bave yielded full adherence to enterprises and projects which gratified their fancies or hlinded them with the illueive hopo of some great and speedy aggrandizement. Following these splendid visions of easy fortunes by fortunate stroke rather than hy busbanding of labor's rewards, tbey have borrowed from every lender, and, as their air castles vanished, they find themselves laden with great weights which they can only discharge by return to the old pathway of diligent labor and self-denying economy. It is a weary work, after one has fed on fancies and dreamed of no labor but tbe waving of a magical wand, to return to tbe toil of the plow, the sledge, or even to the tiring monotony of merchandising. And yet the return must he made, and happy is he who soonest takes the bint. For years we have been living in an atmosphere of veuture and great undortakings. Thus our whole industrial life has been tinged more or less with refracted light, and not illumined witb the clear white gleam of lahor aod its rewards. During the last few years we have been suffering from the collapse of great hollow ideas which inflated our brains until our skulls seemed nigh to bursting. Now the wrecks of industrial fallacies seem to he clearing away before the returning tide of trutb, and there is hope for the return of the good and enduring prosperity of earlier days.

The world's history is a long tribute to the virtues of industry and economy, and a warning against their opposites. The experience of this last era when it shall be written, will bnt strengthen the old truth. It will point the true course to nations and to individuals. It is a hopeful sign for the future of California's industries that the lesson is heing widely learned. The arts of production were never more closely studied thau now, for it is a vital point that wastes sbnll be stopped and effective work promoted. Let nur industries now have their proper place in the minds of the people. Let the deludiug thrall nf specious schemes pass away. Let us come down to the soil, the mineral, the mstal, assured that though the steps be hard aud the progress slow, we ars in the true psth which will lead ns sway from the debris of exploded fallacies into ths free npen field of honest effort and temperats living. By thie sign we shall conquer; nnd California will ere long he known, not as the land of grest illusions, but as tho homo of a labor-loving, economical and prosperous peoplo—a land living no longer in tho memory of nn illustrious past, but in the realization of a moro glorious present, and cherishing the hope of a future beyoud anything we now can know.

* "Ths Stagnation of Trade, and its Cause," by Prof. Bonamy Price, in *North American Review*, for June.

Eastern Money and Western Mines.

In so far as such fact can be supposed to hnve any significsnce, the adoption of a new Constitution by the people of California has not deterred Eastern capitalists from investing in our mines. Hardly ever has the business of bnying, bonding or otherwise dealing in these properties been more active than of lats. There is, as we well know, much idle capital in eastward lying countries. The money repositories thero are replete with unemployed funds. Investors are casting about for ventures that promise security coupled with a fairly profitahls issue. They regard our gold aud silver mines with favor. But their experience in ths mines of the far west has not always been bappy. They havs now and again met with financial reverses off this way. So they have grown a little more chary than at first. They are willing to embark their means freely in mining, but they insist nn having properties of merit in return, and in this requirement we trust there will he no letting up. On this point we hope they will show themselves exacting — inexorable. There are plenty of first-class mines in this country for sale at moderate prices. It is just ns easy tn obtain a good one as a poor oue, of which latter there have been too many already palmed off on the Eastern public.

Among receut transactions of really sterling properties, we note the sale of the Taylnr Flat hydraulic mines with water franchise, etc., to moneyed men in Indianapolis, United States Treasurer New, heing one of the two or three purchasers. This property is situated in Trinity county and is highly spoken nf by those acquainted with it. The Buckeye water and hydraulic company, owners of extensive gold-bearing gravel lands, ditches, water rights, etc., also in Trinity, have just obtaiued in the East the large sum of money necessary for extending their main ditch to its priocipal source of water supply, for finishing tbe long bedrock tunnel now in progress and otherwise putting their grounds in good shape for the heavy nnd profitahle production that awaits a resumption of operations.

Samuel Leet, of Oakland, bas just completsd the sale of a large hydraulic property located on the Forest Hill divide, Placer county, for the sum of half a million dollars, one-fifth of which has been paid down. The buyers reside in the East and bave made a good purchase. The gravel bere is of excellent quality and great depth. The mine has been opcned and equipped, has ample outlst, water supply, etc. Ths Ward silver mine, in the Reese River country, has also cbanged hands of late, and will be worked hy Eastern capital. Tbis mine, which liss in the ricb mineral belt tbat has given distinction to Lander Hill, has a singular history. Having been located at ths time of the Reese River excitement, it was considered for a while one of the most promising properties in that locality, the croppings carrying orc of an exceeding high grade. These rich surface deposits having been hurriedly worked out, the locators ahandoned the claim, which was neglected until recently, when a miner named Tbomas Ward took it up, had it recorded and went to work upon it. After sinking but a short distance the rich ore came in agaiu, and following it, the owner, who had not a dollar at the start, bas since taken out enough ore to make him a tolerably rich man. The last lot of ore extracted by him, amounting to 232 tons, yielded at the Manhattan mill a gross product of $104,000, being an average of more than $400 per ton. The ore body is shaping for a large deposit, and this is now regarded the most promising property on Lander Hill. The new owners bave commenced a deep exploratory and working shaft, and taken other steps looking to systematic and thorough development as well as the extensive beneficiatiog of the ores, such as the erection of hoisting works, mills, furnaces, etc.

We hear of many other similar sales to parties abroad, the details of which we will take pains to collect for early publication, and whicb tend to show that confidence in the value of mining properties on this coast has not of late suffered impairment in the estimation of Eastern investors. Not only in the purchase of miuing properties does this well-sustained confidence manifest itself, but also in the purchase of mining sharcs, many of the orders for which come from the East. Heavy deposits on Eastern account have also heen made in our city banks, thcse funds to be dishursed in purchase of mining stocks. The shares of several of our more prominent mines, such as the Standard, Bulwer, Bodie, etc., are meetiug with large sale at the New York mining board, where they are not only well received, hut seem to be speoial favorites.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

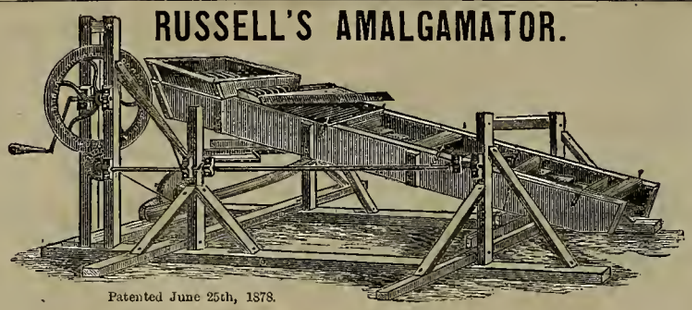
Patents OBTAINED IN U. S. AND FOREIGN COUNTRIES; trademarks, labels and copyrights registered through DEWEY & CO.'S MINING AND SCIENTIFIC PRESS Patent Agency, San Francisco. Send for free circular

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

J. MORIZIO, Gen'l Agt.,

Room 24, Safe Deposit Building, Corner Montgomery and California Streets, SAN FRANCISCO.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Barlow J. Smith, M. D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervous derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examination with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 3 P. M. Sundays from 9 A. M. to 12 M.

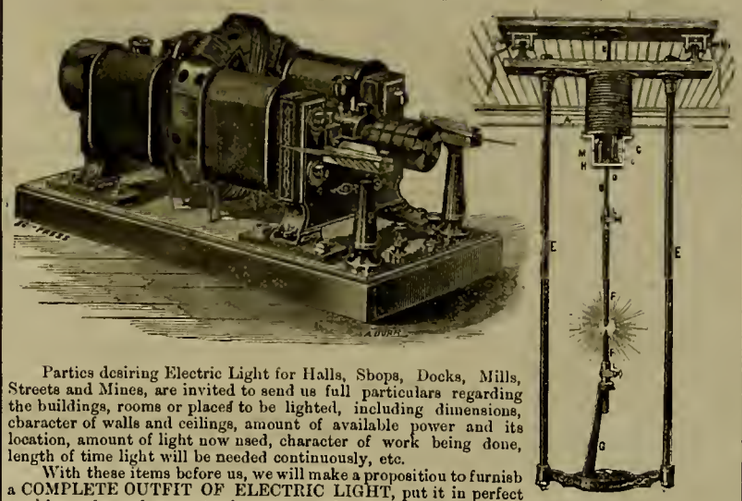
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.
With these items before us, we will make a propositiou to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO.,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

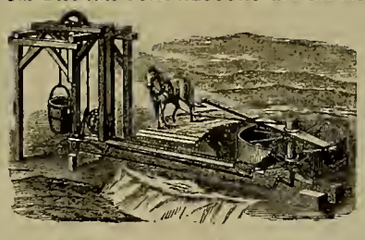
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO., 18 & 20 Fremont St., San Francisco.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

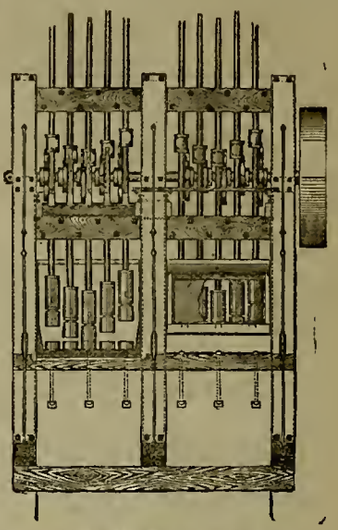
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

Machinery.

GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

MOREY & SPERRY,
No. 145 Broadway, - - NEW YORK.

J. THOMSON. C. H. EVANS

THOMSON & EVANS,

(Successors to THOMSON & PARKER.)

Engineers and Machinists.

Rubber Suction HOSE Made to Order.

All Sizes of Gas and Tube FLANGES.

Steam Pumps, Steam Engines, Hoisting, Pumping, Quartz Mill, Mining, Saw Mill Machinery, Specialties.

Plans and Specifications for Machinery furnished. Repairing promptly attended to.

110 & 112 Beale St., San Francisco.

THE IMPROVED O'HARRA

CHLORIDIZING FURNACE.

Patented Sept. 10th, 1878.

Now in Operation at the Extra Mining Co.'s Works, Copper City, Shasta Co., Cal.

Two men and two cords of wood roast

Forty Tons of Ore in Twenty-four Hours,

Giving a full chlorination (100%) at a cost of 30 cents per ton. Address,

O'HARRA & FERGUSON,
Furnaceville, Shasta Co., Cal

Or CHAS. W. CRANE, Agent,
Room 10, Safe Deposit Building, San Francisco.

Dewey & Co { 202 San-some St. } **Patent Ag'ts**

Continued from page 365.

720 ft, still cutting a mixture of clay, quartz and porphyry.

HALE & NORCROSS.—Repairs to the main shaft are still being made. The eighth station is being rebuilt with 16-inch timbers.

YELLOW JACKET.—Putting in the new spur-wheel. The shaft is down 2,577 ft. The drift west, 2500 level, is in 130 ft, the face in dry, hard, blasting porphyry.

BROPHY.—Advancing the tunnel at the rate of three ft per day. The material is a little softer and indications are improving.

BEST & BELCHER.—Sinking at the Osbiston shaft is progressing slowly on account of the strong flow of water.

LEVIATHAN.—On the 750 level the lateral drift north shows about half its face in low-grade ore and hard, vein porphyry. The south lateral drift on the same level continues in porphyry, with good-looking streaks of quartz occasionally coming in.

CROWN POINT.—The north drift, 2500 level, is now in 439 ft. This drift is being pushed along the west line of the ledge, and has encountered some very fine indications. The winze from the 2500 level has been sunk 25 ft below the 2700 level for a sump, and the station is now being opened.

SILVER HILL.—The sump of the incline below the 1300 level has been completed, and the incline is being prepared for lowering the pumps. The Boston and Thompson mills have been set at work reducing rock from the upper workings. Each has a capacity of 15 tons per day.

NORTH CON. VIRGINIA.—The property of this mine has been sold and transferred to the Sierra Nevada, Union Con. and Mexican for $1,100,000, and the deeds are recorded. Sinking is going on as usual.

LADY BRYAN.—The station, 750 level, is chambered out, and drifts are now to he run east and west from it to open up a portion of the mine as yet unprospected.

OULD & CURRY.—The repairs to the drift connecting with the Savage on the 1750 level have been completed. Sinking at the Osbiston shaft is somewhat obstructed hy the heavy flow of water.

HOMESTEAD.—Work is steadily progressing in the joint Homestead drain tunnel. After advancing the tunnel a few ft further a crosscut will be made.

UTAH.—The incline is 564 ft on the slope below the 1350 station. It is encountering a little more quartz as it is carried on down, but as yet this quartz is low grade.

ANDES.—The crosscut east from the top of the upraise from the 350 level is still in good-looking quartz, but of low grade.

MT. HOOD & VANCOUVER.—Still drifting toward the ledge. The average progress has, until lately, been four and one-half ft per day, and a little over four ft are being run daily now. The rock is hard porphyry.

EXCHEQUER.—North drift, 2400 level, is making four ft per day, and gradually entering a formation of low-grade quartz; total length, 460 ft.

NEW YORK.—The incline is being continued on below the 1200 station, and is making about four ft per day. Everything working well.

SUCCOR.—Some fine-looking rock continues to be cut in the north drift, 1100 level, and the drifts east and west, same level, still look well.

BELMONT DISTRICT.

BELMONT.—*Courier*, May 31: The mine presents a marked improvement. The ore body between 300 and 400 levels is looking splendid with the character and quality of ore daily improving. In the 300 level drift they have a streak of nice ore which is increasing in size every foot they advance the drift, and they hope ere long to be able to report a large body of ore in this part of the mine, as the prospects were never more encouraging than at present.

EUREKA DISTRICT.

HAMBURG.—*Sentinel*, June 1: Work throughout the mine has progressed as usual during the past week with no material changes to note. The west crosscut, 600 level, is now in 318 ft, its face is in red broken lime with seams of low-grade ore. The east crosscut from the south drift, 600 level, is now in 60 ft; the rock in the face is unusually hard. The ore body found near the old Hamburg shaft continues to look well, and is yielding ore of extra good quality.

FOURTH OF JULY.—The stopes above the lower tunnel level continue to look well, and are yielding a considerable amount of extra good ore. The north drift, from the bottom of the cave, was continued 18 ft. The vein is small at this point, but it continues to be of good quality. They will commence sinking a winze below the lower tunnel level in a few days.

EUREKA CON.—Mining operations have been continued through the week and good progress made, there having been 181 ft of drifts, winzes and inclines completed during this time. Have commenced cutting out for station at the 14th level. Three furnaces are now running and turning out the usual quantity of bullion. The following work has been done on the several levels: 4th, started drift running northwest, and made 18 ft; 5th, east drift continued 25 ft, and now in 139 ft; 7th, northwest drift continued 14 ft, and now in 65 ft; southeast drift continued 31 ft, and now in 131 ft; 11th, west drift from ore chamber continued 15 ft, and now in 60 ft; 12th, started winze in bottom of west drift, and sunk 24 ft; 13th, east drift continued 15 ft, and now in 92 ft; west drift continued 14 ft, and now in 94 ft; incline sunk 25 ft, and now down 130 ft to the 14th level station.

GOOD HOPE DISTRICT.

GOOD PROGRESS, ETC.—*Silver State*, May 31: Good progress is being made in all the mines in which any work is being done at present. Paige and Kelley have sunk a shaft about 120 ft deep on their claim, and are now drifting on the 80 level. The ledge is about four to five ft thick, with 20 inches of pay ore. It is principally ruby, and of a very high grade. Mr. Rhinehart thinks this is the best claim in the camp at the present time. The U and I mine is producing a good quality of pay ore, and the developments in the mine during the past week or ten days are very encouraging to the owners. The Buckeye has a good ledge, but owing to the hard formation, work progresses slowly. Some rich ore has been taken from the mine, and during the summer the owners will make arrangements, if possible, to have a considerable quantity of it milled. No work is being done on the Silver Brick or the Aurora mines, though when operations ceased, the ledges were looking well and the prospects promising. The flow of water in the Aurora shaft caused a suspension of work, and it will be necessary to put up some machinery before operations can be resumed. It is likely that further developments will be made in the Silver Brick during the summer. A great many sales of feet in the claim have been made recently, and it seems that the owners cannot agree as to the best me thod of working it.

PARADISE DISTRICT.

SEDAN MILL.—*Silver State*, May 31: The Sedan mill is now running steadily on Bullion ore, the proprietor of the mill having purchased all the ore on the Bullion dump—amounting to about 300 tons. The mill, with only five stamps, is producing on an average of $400 worth of bullion daily.

ARIZONA.

SILVER DISTRICT NOTES.—*Sentinel*, May 31: On the Red Cloud, four men are taking out 20 sacks of ore per day. They have uncovered a large body of rich metal at the northern end of the claim, two and one-half ft wide, and are working along at a depth of four ft; solid chunks of metal are broken out weighing over 400 pounds, which are broken up and sacked. This body has been followed to within 10 ft of the adjoining claim, the Emma. Two men are plackering the mesa, finding nuggets of 40 and 50 pounds. The Iron Cap mining company has let a contract for a shaft 100 ft deep, to be completed within 70 days, at $11 per ft, on the Iron Cap mine, and is negotiating contracts for sinking shafts on their five other mines. On the Rover, four men are working in the tunnel taking out ore and four are sinking the shaft in which they have struck ore; the men are working night and day. The shaft of the Black Rock is down 103 ft, at the bottom there is a vein of rich ore four inches wide. The adjoining claim, the Silver Glance, is yielding rich ore, five men are at work. On the Engineer, three men are working; the tunnel is in 50 ft, the drift 12-ft, and the shaft in drift is down 20 ft. At the bottom of the shaft there is a three-ft vein of good ore. The Klara has two men taking out ore. Two men on the Remnant are sinking a shaft, following a 10-inch vein, and are down 14 ft. Interest in the Rough and Ready, Clip, Iron Clad and other claims have been sold and still others bonded.

OREGON.

MINING ITEMS.—*Times*, May 30: The Squaw Lake company has been resetting its pipe, and is by this time moving the gravel at a lively rate. Robb & Co., at the Hamilton diggings, expect to commence making a final clean-up for this season in the course of a week or two. Claims on Silver creek command fair prices. One sold for $300 recently, and several others have changed hands at more reasonable figures. The parties from California prospecting the old Johnson ledge at Blackwell are said to be getting out good ore, which promises to be abundant. E. K. Anderson, at the Forty-Nine diggings near Phœnix, has washed considerable ground during the season, and is sanguine of excellent results. John Egan and others will at once resume the prospecting of a quartz ledge in the Willow Springs district, upon which some work was done last year. James McDonough has several specimens of very rich ore taken from the shaft of the Fort Lane mine at a depth of 40 ft. They exhibit free gold in abundance. Operations will soon be commenced on the ditch that the Savage Bros., F. M. Plymale, J. B. Wrisley and others intend running from Savage creek to some promising gravel beds in the vicinity of Rogue river, two miles beyond. Parties from Briggs' and Silver creeks report that recent storms have delayed mining operations there. Several hundred miners are now in that section getting ready to work the diggings, which in many cases prospect well. J. T. Layton and Kuhli & Bolt, who are running hydraulics on Farris gulch, made excellent clean-ups last week, which establish the value of their diggings. They will have plenty of water for several months to come. Messrs. Chadwick, McNevin and Lightner, who are doing much to revive the failing interest in quartz mining, are also turning their attention to placer mines. They have been and are now visiting several hydraulic claims in this county, and may conclude to invest. Johnson & Allison, mining on Jackson creek, made a partial clean-up last week, which proved a satisfactory one. They picked up several pieces of gold, one of which weighed $4.95, and another over $6. They will he able to pipe a few weeks longer before cleaning up finally.

Proposed Closing of English Coal Mines

The coal miners of the United Kingdom are in trouble and troublesome. The continued downfall of wages, the keen competition of capitalists, and ths constant guerilla warfare carried ou between them and their employers for the past four or five years has rendered them destitute and despsrate, and has led them to attempt united action for the adoption of soms means hy which a continuance of the prssent state of things may he prevented. To this end an important circular has beeu generally issued throughout the kingdom calling on all mining districts to send representatives to a confersnce convened to discuss the advisability of laying the whols of the mining communities of Great Britain idle for from four to six wesks. The following is an extract from the circular:

"Wales has been used as an instrument to hring wages down in Northumberland, and Northumherland, Durham, South Yorkshire and West Yorkshire and Lancashire, Cheshire, Derbyshire, Leicestershirs and North and South Staffordshire have played the same tune. Scotland also has heen passing through a like ordeal, heuce the desirahility for united action in trying to put an end to this ringing the changes on our hard-struggling miners' wages. The profits of colliery owners must not he allowed out of the hard-earned pennies of the miners. It has often heen said hy colliery owners and managers, from the first reduction downwards, that the collieries could not he carried on unless their workmen would concede to a reduction in thsir wages. This was said when coal sold at three times its present selling price, and the sams thiug is said now. Well, if the coal owners could not make a profit with coal selling at 18 shillings per ton, with the coal getters' price on an average at 2 shillings per ton, how in the world are they going to make a profit with coals selling on an average at 6 shillings per ton, with an average to the coal gettsrs of 1 shilling per ton. The statements of the owners ars ahsurd in the extreme, and the miners of this country must not lose sight of the fact that if they were to give the owners the remaining 12 psnnies, if owners cannot live now, neither could they live then."

One district has suggested that each district send in a notice for an advance in wages of 20%, and if the owners do not concede that all cease work until the same he granted. The conference was to meet in the Miners' hall, Barnsley, about the middls of May. As yet nothing has heen heard as to the results of the meeting nor of the action taken.

Bullion Shipments.

Sincs our last issue, we have noticed ths following bullion shipments:

Hillside, from May 30th to June 4th, inclusive, $11,000; Alexander, May 31st, $9,100; Northern Belle, May 28th, $2,428.86; Argenta, June 2d, $10,500; Independence, June 2d, $10,100; Ophir, from May 26th to May 31st, inclusive, $31,945.99; Standard, May 30th, $17,701.70; Christy Con., June 3d, $10,873.

AMONG the speakers at the next Yale commencement will he Chun Lung, a Chinese memher of the class of 1879, who will deliver an oration on "The Chinese in America."

ALL forms of auhscription to the 4% bonds have been closed at the Treasury Department in Washington.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING MAY 27TH, 1879.

LAMP SHADE—P. K. Ouild, Santa Barbara, Cal.
AUDER—Wm. Heyd, S. F.
CONSTRUCTING LEVEES—M. C. Lawlon, S. F.
ROLLER AND PULVERIZER—Geo. Meding, S. F.
SELF-ADJUSTING BRACELET—W. A. L. Miller, S. F.
HORSE CLOTHING—J. C. Simpson, Oakland, Cal.
ORE ROASTER—D. W. Brunton, Silver Peak, Nev.

The following foreign patents have been issued to residents of this coast:

English Patents

Which have passed the great seal:

104.—IMPROVEMENTS IN DRILLING APPARATUS—H. Richmann and U. K. Arnold, S. F. Jan. 10th, 1879.
327.—IMPROVEMENT IN BATHS—W. Wasson and C. N. Harris, Carson, Nev. Jan. 27th, 1879.

German.

5,678.—MANUFACTURE OF SLASS OF PESSLES AND ASPHALT Zadig and Neuberg, S. F. and Hauover. Nov. 10th, 1878.

Victoria.

2,6f9.—IMPROVEMENTS IN APPARATUS EMPLOYED IN THE PROPULSION OF TRAMWAY CARS SY MEANS OF ROPES—Wm. Eppelsheimer, S. F. Jan. 30th, 1879.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telgraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently ohtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

STEAM BOILER.—M. N. Laufenherg, S. F. Dated, May 20th. This improvsment in boilers, consists in a novel construction of the hoiler and fire-box, and the parts relating thereto, so that ths inventor ohtains more heating and tuhe surface, utilizes a certain portion of the firs-box without decreasing its capacity, and prevsnts the clogging of the tuhes, hy inducing certain draft currents in the fire-box depending upon its peculiar shape, ths grate and draft opsnings. While the engine is applicable to all kinds of hoilers and furnaces, it is especially applicable to those where it is intended to uss straw and and other light fuels which the draft has a tendency to carry into and against the ends of the fluss so as to clog them. The objects described the inventor accomplishes hy extending the tuhes into the upper part of the fire-hox, and sccuring them into a tube shect which depends from the crown sheet, at a point hstween the front and rear walls of the fire-hox, said tuhe sheet extending across the fire-box so as to he united with the side walls, while the plate beneath the tuhes is made in the form of an arch so as to concentrate and intsnsify the flame at that point, and also for ths purpose of preventing deposits heneath the tuhes. In comhination with this construction, Mr. Laufenherg employs a peculiar partial grate, having a draft opening or space at the rear and a plate in front, extending a short distance back from ths door so as to direct ths currents of air and assist ths comhustion.

AIR COMPRESSOR.—Jno. B. Pitchford, Gold Hill, Nevada. Datsd May 20th. The improvements in this air compressor consist, first, in a peculiar construction and operation of the discharge valves, wbereby, hy suitahle connection to the stem of said valves, whicb operate in sleeves or cylinders, the supply of water to the air cylinder is automatically regulated, and no water will be used in the cylinder unless the compressor is working, hut not then until the air valve opens, which is the time it is needed. Second, in the use of a peculiar governor in ths steam cylinder which is so connected with ths pipes leading from the compressor to the air receiver, that the speed of the engine is regulated hy the pressure of air in the receiver. Third, in the use of rubber plates on the piston for the purpose of rsducing the clearance spaces, hy means of which almost all the air can he sxpelled from the cylinder at each stroke. It furthsr consists in the method of placing the inlst valves and the drip plates connected with them, and also in comhining hrass rings and hemp packing in the piston so as to carry the moisture all around the piston in ths air cylinder hy capillary attraction and thereby kesp it luhricated.

FIRE LIGHTER.—Chas. E. Thompson, Stockton. Dated May 20th. This invention relates to a device for lighting ths fires of enginss, being more particularly intsnded to he applied to steam fire-engines where it is necessary to start the fire quickly. The improvements consist in mounting on a suitahle har under the grate of the hoiler a cup containing certain chemicals, and placing in said cup a glasa vial of liquid which when mixed with the chemicals in the cup will generate a flame to light the kindlinga in the fire-hox. Levers are arranged to he operated from either end of the engine hy means of cords, so that at the proper moment, hy operating a lever, the glass vial oontaining the liqnid will be broken and the liquid bs mixed with the chemicals so as to generate a flame.

SECURING BOOT STRAPS.—C. W. Lane, Aurora, Nev. Dated May 6th. This is a improved method of securing the straps to boot legs so that they can be more permanently and strongly fastened, and it consists in the employment of a metal clasp or rivet passing through the strap and legging and firmly binding them together.

SELF-CALCULATING WEIGHER.—J. S. Phillips, S. F. Dated May 20th. This is a novel apparatus for assayers' and prospectors' use, whicb is called the "Little Wonder" self-calculating sample and hutton weigher. We recently illustrated and descrihsd this device in detail in the PRESS.

News in Brief.

ARIZONA bas now ten newspapers.

OTTAWA is plagned with the smallpox.

INDIANS are committing murders in Texas.

PRESIDENT HAYES has so far scorsd five vetoes.

ALEXANDRIA, Egypt, is threatened hy a flood.

BARON ROTHSCHILD the great hanksr is dead.

A DISASTROUS cyclons has occurred in Missouri.

THE great Salt laks has rissu 11 fset since 1857.

THE increase of tbe public debt for May was $62,250.

BERMUDA had a heavy earthqnake on the 28tb nlt.

THE rivsr Po has risen and threatened damage to Turin.

AN overflow of Frazer rivsr is doing considerahle damage.

SILVER REEF, Utah, has been largely destroyed hy fire.

SEVENTEEN more Chiness lspsrs have bsen shipped for China.

THE Columbia and Willamette rivers in Oregon, ars rapidly rising.

THE Mechanics' Bank at Montreal, has snspended payment.

THE Dauish Polar expedition has heen heard from, and is safe.

A LARGE barrel factory is to be estahlished at Seattle, W. T.

THERE wsrs 80 deaths and 34 marriagss in the city last week.

MALIGNANT scarlet fever is prevalent in Los Angeles connty.

THE late Kansas cyclone killed 40 people and injured 70 or 80 more.

A MOUNTAIN lion is ravaging the Ravenswood mountains near Austin.

THE Manbattan Savings Bank burglars have at last been discovered.

THERE is a strike in progress among Buffalo, N. Y., "longshoremen."

A TWELFTH part of Warwickshire, Eng.,—100 farms—is advertised to let.

BRITISH troops in South Africa are suffsring from fever and dysentery.

RUSSIAN grain crops are suffering from the ravagss of a small insect.

THE Napa county mines lately shipped 37,750 pounds of quicksilver.

THE Portuguese cahinet has resigned and a new one is to hs appoiuted.

THE new military telsgraph is built to within 18 miles of Lswiston, Idaho.

DURING the month of May ths San Francisco police arrested 1,636 persons.

THE treaty of peace hetween England and Afghanistan has heen ratified.

IT is proposed to commence work on the Panama canal early in the fall.

THIS has heen the coolest season ever experienced so far in Fresno county.

THE Walla Walla *Statesman* pronounces the Snake River mines a "grand fizzle."

THE wheat crop near Salem, Orsgon, averages three fest in hight, and is very large.

SINCE cutting the hay crop, farmers around Chicb ars largely summer-fallowing.

THE first case of sunstroke for the season is rsported from San Luis Ohispo county.

AT the U. S. Mints during May, 1,795,090 pieces were coined, valued at $2,094,508.

THE Khedivs will accspt the nomination of European controllers with extended powsrs.

Two Cheyenne ladies have emharked in the cattle business, with 500 cows each as a starter.

ANDRUS and Brannon islands are fast getting out of watsr and into condition to raise crops.

THERE are 300 hoats engaged in fishing on ths Sacramento river, with two men to each hoat.

A LOAN is to be issued hy Russia for 300,000,000 roubles, to cover the expenses of the late war.

THE Puget Sound U. S. coast survey appropriation has run out, and work has been suspended.

NINE persons have died at Newark, N. J., from drinking poisoned watsr, and other are not expected to live.

Two car-loads of ore from a Battle Mountain mine, lately shipped to Salt Lake City, assayed $20,000.

THERE has heen a great eruption of Mount Etna, and several villages are seriously threatened.

UP to the lat of May the losses in the United States this year from fire have aggregated $32,381,000.

ABOUT 4,000,000 tons of rails are required yearly to replace worn out atock on the railroads now existing.

Back Numbers Wanted.

The following volumes and single copies of the MINING AND SCIENTIFIC PRESS are wanted at this office, for which a reasonable price is offered:

Year.	Volume.	
1870	20	2 Complete volumes, 1st half (of year).
1870	20	2 Copies of No. 2, Jan. 1st.
1870	20	1 Copy each of No. 1, Jan 1st, 3 of Jan. 14th, 7 Feb. 11th, 6 Feb. 4th.
1870	21	1 Copy of No. 7, August 13th.
1871	22	6 Copies of No. 1, Jan. 7th.
1871	22	8 Copies of No. 5, Feb. 4th.
1871	22	1 Copy of No. 3, Jan. 21st, 6 of Feb. 2d, and 1 of May 1st.
1871	23	1 Copy of No. 2, July 15th, and 9 Sept. 2d.
1872	24	2 Copies of No. 4, Jan. 27th.
1872	24	3 Copies of No. 7, Feb. 17th.
1872	24	3 Copies of No. 17, April 27th.
1872	25	2 Complete volumes, last half (of year).
1873	26	4 Copies of No. 8, Feb 22d.
1873	26	3 Copies of No. 0, March 1st.
1873	26	4 Copies of No. 10, March 8th.
1873	26	2 Copies of No. 7, Feb. 15th.
1873	26	1 Copy of No. 6, Feb. 8th.
1873	27	4 Copies of No. 20, Nov. 15th.
1873	27	6 Copies of No. 21, Nov. 22d.
1873	27	4 Copies of No. 24, Dec. 13th.
1876	30	2 Copies of No. 4, Jan. 23rd.
1875	30	2 Copies of No. 5, Jan. 30th.
1875	30	1 Copy of No. 6, Feb. 6th.
1875	30	2 Copies of No. 8, Feb. 20th.

SOUTH PACIFIC COAST RAILROAD.—This popular line has made a reduction in rates between San Francisco and San Jose and Santa Clara, to take effect April 1st, 1870, viz: Regular local tickets between San Francisco and San Jose, $1.76; Santa Clara, $1.65. Round trip tickets (good until used) between San Francisco and San Jose, $3.25; Santa Clara, $3.05. Excursion tickets sold Saturday afternoons and Sunday mornings from San Francisco and Park street, Alameda, to Santa Clara or San Jose and return, $2 50; good only until Monday evening following date of purchase. Commutation tickets good for one round trip daily during calendar month, between San Francisco and San Jose, $20; Santa Clara, $10. Family tickets for 10 rides and 30 rides, also six months and yearly commutation tickets on sale at corresponding reduction in rates.
GEO. H. WAGONER, Gen'l Pass. Agent.
THOS. CARTER, Superintendent.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Friebie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 415 Market St., second floor, S. F.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free. Address

DEWEY & CO.,
202 Sansome St., N. E. Cor. Pine,
San Francisco.

DESIRABLE OFFICES TO LET.

We have several sunny Rooms (lately occupied by A. W. Bowman and associates), adjoining the Mining and Scientific Press Patent Agency, at No. 202 Sansome street, corner of Pine, which we will rent permanently on very reasonable terms. Parties desiring pleasant office rooms should call and see them.

DEWEY & CO.,
No. 202 Sansome St., opp. Pacific Bank, May, 1879.

N. B.—Rooms from $15 to $25 per month.

Books for Miners and Millmen.

KUETEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 672 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10 50 Sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2 Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Trustees, held on Wednesday, the twenty-first day of May, 1879, an assessment (No. 38) of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary at the office of the Company, Room 8, No. 402 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the first day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eleventh day of August, 1879, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of the Board of Trustees. W. O. WILSON, Secretary.

Office, Room 8, No. 402 Front street, San Francisco, Cal.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, Cal.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1) levied on the 17th day of April, 1870, the several amounts set opposite the names of the respective shareholders, as follows:

HOPE IRON WORKS,

— CONSISTING OF —

Pattern, Machine and Blacksmith Shop,

AND FOUNDRY.

Address THE HOPE IRON WORKS,

Potrero, San Francisco.

STEVENOT'S
Fine Gold Amalgamator.

Adapted for Ores, Tailings, Slimes, Etc.

Unequaled for Cheapness, Lightness and Practical Results.

No mechanism required to run it. Worked entirely by pressure of water throwing the ore forcibly on to and through a body of mercury.

E. K. STEVENOT,

Chemist and Mining Engineer,

304 Montgomery St., San Francisco.

REPORTS MADE ON MINES. Quartz Mills, and Works of every description started.

NOTICE
TO THE
MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the Licenses of this Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the licenses of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Parsdise Valley, Jeffcreon, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Pomoees.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,
Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News.*

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

Union Brass Foundry and Mechanical Work Shop.

GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

STEEL CASTINGS.

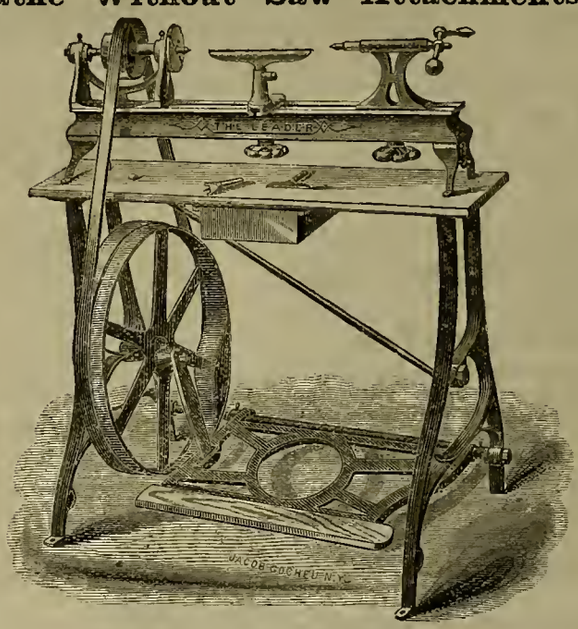
Lathe Without Saw Attachments.



This Lathe has been made especially to meet a want felt by many for a really good and substantially made Foot-Lathe at a reasonable price, and we think that we can safely say that it is by far the best Lathe ever placed on the market at the price asked. The bed, head, and tail stocks are of iron; the spindles of steel. The bearings of the head stock is conical, so that the wear can be easily taken up.

Material eighteen inches long and eight inches in diameter can be turned on it. The pieces that accompany this Lathe without extra charge are two T rests, two plain centers, one spur center for wood turning, and one face-plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe with Scroll Saw Attachment.....$55.
Price of Lathe with both Scroll and Circular Saws, $70.

Trump Drill Chuck.

Chuck, for drills ¼ and under, Price.....$1.50

Chuck, for drills ½ and under, Price.....$2.25

They are made on solid steel plug, centered and *readily fitted to Lathe or Drill Press.*

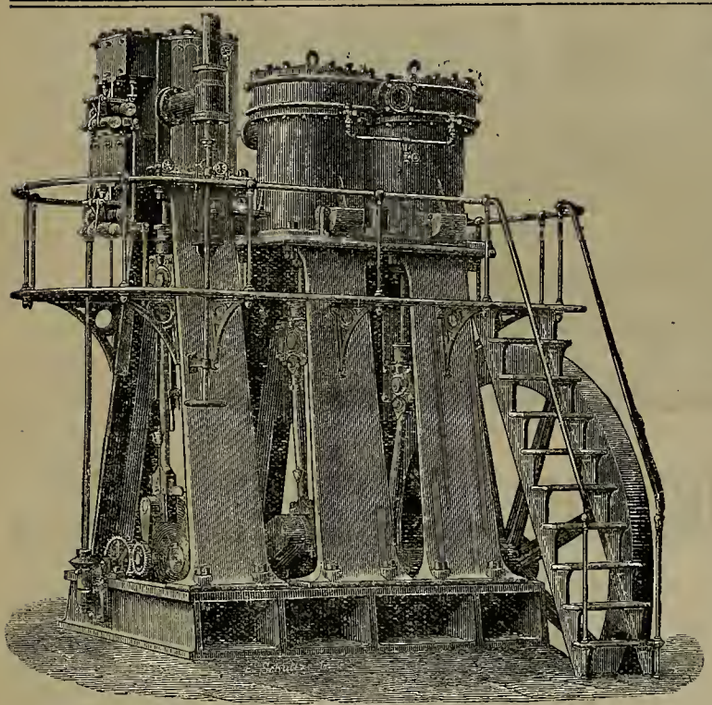
AN ENGINEER,

Favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design Stationary, Marine, Locomotive, Mill Work, Sugar and Hydraulic Machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

No. 417 Market Street, San Francisco.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

The Discovery of Gold in India.—No. 2.

The dip of the Soutb Wynaad ledges is nearly always to the east, and at tho higber psaks wbere outcrops appear, is very low—only about 10°, the ledge semstimes forming ths back or slope of a billside—on sntering lower ground they are found to increase in dip, and average from 15° to 30°. Almost invariably wbere the le lgs runs parallel to ths run of tbs hill, an abrupt and steep fall will be found to occur to the west of the strike, forming a bold escarpment, while on the sasteru sids the slope of ths hill is very gradual. This is caused by the hard overlie and top of tbe ridge forming a back and protection to the eastern slope, enabling it to resist the action of denudation, while the western has been completely denuded. The underlis on the western sids, the soft foot-wall, and tbe soft scbistose casings beneatb easily disintegrating and crumbling away; thus land slips are formed, rssulting in an escarpment, and the gradual wsaring away of the ledge from west to sast. Fig. 1 shows the section of a hill in the nsigbhorhood of Monarch Reef, whicb, as we msntionsd in a former article, has been tracsd for nins miles. Ths figurs sbows the outcrop of the ledge, and tbe manner in wbich tbe ledge is gradually wearing away from west to east; *a* sbows tbs hard snrface of the ledge, whicb for soms distance forms the surfacs of the eastern slops of ths bill; *b*, soft foot-wall; *c*, *c*, leaders and soft ground, full of ferruginous bands of quartz laminated witb motber rock, decompossd seft laminated, and very varied, but all red or yellow in color; *d*, *d*, tbin strata of nnderlying talcose scbist; *e*, boulders of compact veinstone, fallen down; dotted lines show where ths ledge bad oncs continued, but tbrougb vast ages bad washsd away; x, x, x, vast old workings and rsmnants of extensive sluicing and washing.

The rude implsments possessed by tbe ancient miners prevented them working the denss, compact, adamantins, but ricbsr stonc of the ledges, and thsir efforts were directsd solely to tbs working of the soft ledges and debris carrisd down into tbe valleys hy denudation of the higber ledges, and to tbe eluicing down of soft eartb and cement, afterwards collecting the gold which settled down among tbe stones which paved the bottom of tbe sluices. And Fig. 1 ebows the advantages taken by tbem of tbe workinge of natnre in denuding the bard and unyielding ledges, whicb would naturally resist their nnaided efforts. Their intelligence tangbt them the necessity of desulphurizing ore by means of fire, especially in tbe reduction of auriferous pyrites. Our means of knowledge concerning their implements are very limited, yet we may very correctly infer tbe absence of durable implements, since none are found in tbis district, imperfect as the exploration has beretofore been, but a more careful survey of the whole field may disclose evidences which will connect the workings of the ancient East Indian miner with his equally ancient co-worker in tbe mines of Arizona and Mexico. Tbat tbey had a substantially correct knowledge of mining is evident from their calcining auriferous pyrites before crushing, wasbing and amalgamating the residual fine gold. The retraced sluicings, as illustrated in tbe last number of this journal, and Fig. 2, bere eubjoined, sbow an intelligent capacity not altogetber in accordance with our first crude impressions of aboriginal contrivances.

Mr. Brougb Smyth, who was for many years Secretary of the mines at Melbourne, states that tbe yield of the ledges in this district varies from a few pennyweights to 200 ounccs of gold per ton of ore. As labor is extremely cheap at Soutb Wynaad, it is declared that from oue-half to tbree-quarters of an ounce per ton of ore would yield large profits. And Mr. Smyth's discoveries leave no douht as to the value of tbis district. A complete report will shortly be forthcoming, whicb we hope to lay before our readere at an early day. Our present impression is tbat there will not be very much emigration to tbese gold fields, owing to the prohably unfavorahle climatic difficulties. All present information is very meager, and we can only wait to ascertain whether our own slope is to bave a formidable rival in auother Englisb possession.

The San Francisco Free Library.

The Free Library was formally opened io this city last Saturday evsning, witb quits a good attendance. Tbe Presidsnt of tbs Board of Trustccs, Mr. Rogers, made a statoment to the public concsrning the incsption and difficulties in organizing tbe library. Hs explained the character of the "Free Library Bill," of wbicb be was the framer. He statsd that altbough the Supervisors were empowered to give one mill on the dollar of ths taxation, equal to $240,000, to the library fund, tbey bad only given one-tenth or $24,000. The Trustess finding that they had so small an amount, deemed it advisable to let it accumulato until there was funds enough to buy more books. Ths result is tbat tbe library hall bad been taken, fitted up with reading tables, nswspapers, etc., and nearly 6,000 volumes of books, of which probably one-half are beoks of references, at a total expense of some $12,000 to date; and tbey propose to make a circulating library as soon as there are hooks to justify it.

The next point touched upon by Mr. Rogers was that after they had received tbe assurancs of all tbe city officers tbat the money would be forthcoming wben needed, at the last moment tbe Mayor vetoed tbe appropriation, and they now bave no funds, altbough the money had been paid in by the public, and they are entitled to the benefits for the purpose for which it was paid in. The library bas now, however, opened, and he hoped it would never be closed.

After Mr. Rogers had concluded, he called upon Mr. Halbdie to make an address, which contained so many facts of interest tbat we eball publisb it in our next issue in full. Judge Sawyer, Henry George and Ira P. Rankin also spoke, and the library was declared open.

On Sunday there were 700 visitors; on Monday, 850; and on Tuesday, 1,117 visitors—an increase showing evidence of popularity. Tbe library is at Pacific hall, on Busb street, just above the California tbeater.

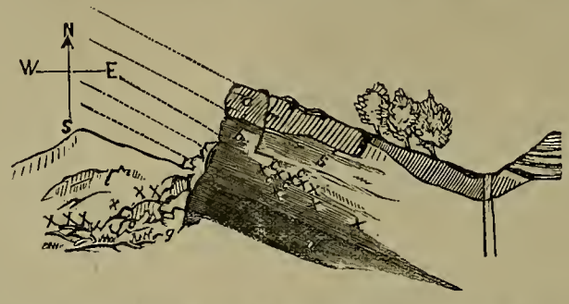

FIG. 1. DENUDATION AND ANCIENT WORKINGS.

FIG. 2. USE OF FIRE IN ANCIENT MINES.

LUBRICATORS.—Tbe valus of a lubricatiog oil lies in its anti-friction qualities. Tbe majority of lubricators pressnting a smootb surface to machinsry in rapid motion, do not for tbat reason possess good qualitics as a lnbricating medium. Microscopie examination reveals the fact tbat certain oils contain a greater or less number of globular bodiss, and tbs greater tbs mass of globules tbs greatsr tbe lubricating properties, because tbs friction being distributsd among many globular bodies relieves ths machinery and increases ths motion. Friction rollers indeed ars frequsntly used to lessen friction, but oils whicb contain unbroken globules answer the purpose psrbaps bstter and at less expense. It is in tbe mauufacture of the lubricator tbat the oil globules are broken up or prssarved intact; if broken, its valus as a lubricator is lessened, whils if preserved sntire its valus is increased. The microscope reveals the quality of tbe oil and determines its value as a lubricator.

PERSONAL.—On Monday nsxt ons of our pioueer citizens, Mr. O. C. Wheelsr, leaves by tbe overland route for tbe East, whitbsr he gees partly to fulfill certain literary engagsments and partly to look after the business of tbe Central Pacific Railroad Company, in wbose eervice he occupies an important and responsible position. The gentleman has heen a resident of California since Febraary, '49, having arrived via tbe Isthmus of Panama on tbe first steamer that ever entered this port. During his long residence on this coast Mr. Wheeler bas occupied a most useful and honorable sphere in a way tbat has secured to him the esteem of numerous friends and tbe confidence of the general public. During his absence in the East he will, in response to an invitation from tbe Faculty of the Southwestern University, at Jackson, Tenn., deliver tbe annual literary address before that institution.

THREE HUNDRED skilled ribbon weavere have left Mulbouse, Alsace, for the New Jersey silk manufactories.

Gold Mining in California.

Notwitbstandiog the advont of tbe regular wet season was later by two months tban usual, tbe prssent is likely to prove a fairly prosperous year with tbs placer miners of California. Tbs rains after tbey sst in were abundant, timsly and long-continued, having fallen at just tbe rigbt intervals and kept on until lato in the spring. Tbs weather too througbout the winter and early spring was generally favorable, the temperature being sueb that ths water was not frozen up about the sources of tbe ditcbes, nor the latter much obstructed witb snow and ice furtber down. Tbs watsr supply to the bydraulic minere bas tbsrsfore been ample, aod the conditions undsr which tbsy have been permitted to uss it all tbat could be desired. Bsing ready to employ ths watsr as seon as it eame, thsir claims having been gotten into good sbape bstimes, tbis class of miners bave mads the most of their opportunities and will bave reason to be satisfied witb tbs results of the seasen's work, now with tbe small operators drawing towards its eloss. Tbe big companies, who for tbe most part own their own ditches, reservoirs and sources of water supply, will bs able to continue piping for sseveral montbs yet, soms of tbem witb a diminisbed head till tbe advent of tbe fall rains.

With the perfection to wbich tbis method of gold gatfiering has besn brought, it stands now in the foremost rank of our miuing industries, a position it will doubtless bs abls to hold hereafter. This department of tbe business does not, bowever, offer a very wide fisld for investment, the unappropriated water at command being insuffioient for any great increase of gravel wasbing. Propsrties furnisbed with watsr and containing material of tbe rigbt kind, with goed outlst and otbsr favorabls conditions, offer the very best opsnings for invsstment to bs found in the entire rangs of mining enterpriss, while tbose differently situated present few attractive features to capital.

Of our lsading bydraulic companies it may bs observed tbat tbe North Bloomfield, the Milton and tbs Eureka Laks companies, on ths San Juan divide, are all running to tbeir fullest espacity and will make large profits the present year. About Quaker Hill, Little York, Dutch Flat and Gold Run, as many as 25 or 30 companies are yet actively at work and will clean up more gold tbis season than ever before. Tbe Excelsior company at Smartville are running off an immense quantity of gravel witb fair returns, tbe extensive repairs on their main trunk ditch baving been completed. In Butte, Sierra, Plumas and Trinity counties tbe bydraulic miners are doing extremely well, some new claims bere having lately been hrought into a productive condition. Along Slate creek and at La Porte there is more gravel washing being done tban usual, while at Brandy City a very satisfactory state of things is reported. This extensive property has lately been put in good shape, some mucb-needed repairs on tbe ditches, flumes, etc., having been effected. When tbe bedrock tunnel, now in progrese bere with that projected and about to be oommeuced, shall reach completion, tbe production of this mine will he more tban doubled, insuring for it a long and prosperous career. From every bydraulic camp on the Forest Hill divide we receive good accounts—also cheering newe from tbe hydraulic mines of El Dorado and Amador. At Blue Tent the breaking of a dam has temporarily interfsred with work, but the structure is to be at once repairsd, when operations will go on as before.

Quartz mining in California is making headway from one end of tbe State to tbe otber. Indeed, of this business, it may be said that it was never in a more prosperous or promising condition than at present. Drift mining is also making good returns and undergoing steady expansion, new ebafts and tunnels being started, and those already under way pushed ahead all over the State. Wing-damming will be undertaken at a good many points along the California rivere this summer, and somo of the dredging schcmes before inaugurated he again revived as eoon as the water reaches a low stage.

THE average weekly shipment of dead bsef from Boston to Europe is about 200 carcasses.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Letter from Arizona.

Extent of Arable Land in the Territory.

EDITORS PRESS:—There is in Arizona but a comparatively small amount of land that will produce crops of any kind without irrigation. Here and there little valleys of a few acres exist high up among the rugged mountains, where vegetables could be grown without other water than the natural rainfall. As for farming on any considerable scale, it is not to be thought of without water artificially applied; portions, though not all of the valley lands along the San Pedro, Santa Cruz, Gila, Salinas and other rivers, yield abundant crops of the cereals where a sufficient supply of water can be brought upon them. As yet, farmers have confined themselves chiefly to raising wheat, corn and barley, but it has been proven that the soil and climate are adapted to the culture of the semi-tropical fruits and other products, and these will be progagated more extensively as population increases.

Scarcity of Water—Settling in Colonies, Sinks, Etc.

The essential defect of the country is a lack of water. In some places it is found where it cannot be used; in others it is wanted where it cannot be found; and in a few places there is plenty where it is needed, as, for example, about the town of Phœnix, in the Salinas River valley, where large tracts regularly yield fine crops, and the community shows a condition of general prosperity. Here the water has not yet been all appropriated, and there is still plenty of fine land for improvement, more in fact than there is water to irrigate. The settlers or colony which proposes to enter upon farming here, has several difficulties to surmount in the start. As these troubles are better overcome by companies than individuals, it is usual to form colonies for the purpose; each member owning certain land and water privileges as may be agreed upon. The first condition is to find enough water for the purpose. This occurs only at intervals along the rivers, the water flowing sometimes for miles at a stretch far beneath the surface of the loose sand which forms their beds, and only rising at points where the bedrock obstructs its underground course. The taking of all the water out of the rivers at certain points seems to have only a local effect. At the present time the bed of the Gila is dry at Florence, the water all being in use, while 20 miles below, the water having gradually come in, flows with a volume quite as large as at Florence. This shows that the rivers carry a great deal more water than might be supposed, and fortunately that settlers above will not interfere, to any great extent, with the prior rights of those below. In preparing for irrigation, large allowances must be made for loss by evaporation and sinking in the light, loose soil through which the *asequias*, or ditches, have to be carried. It sometimes happens that the water taken out does not last to reach the land for which it is intended. The amount required per acre varies greatly with circumstances, but a safe and general rule is to take all that can be had and cultivate as much land as it will supply.

Irrigation—Its Difficulties and Importance.

The next trouble lies in getting the water up from its natural channel to an elevation from which it will flow to the arable lands. This is often difficult, and in many places impossible, as the river beds are usually from 10 to 20 feet below the desired level and hedged on either side by a belt of loose sand, through which it cannot easily be carried without fluming. There are places, however, where the channel is crossed by dikes of hard-pan or country rock. These are selected for the construction of dams, which require to be laid on good foundations to withstand the winter freshets, which sometimes carry them away, necessitating rebuilding. The irrigating ditches are here made wide and shallow, and with as little fall as possible, the land being so nearly level that it is necessary to keep the water as high as possible to be able to distribute over the entire surface. The construction of these canals is not very expensive, the soil being so light, with little rock and no timber obstructions to remove, that the work can nearly all be accomplished with plows and scrapers. Once having the water at a proper hight and clear of the sand belt, it is a comparatively light task to carry it where wanted. In some sections the canals, when in constant summer use, become obstructed with a species of water-grass, which, fastening its roots on the inner banks, grow so rapidly that it has been known to attain a length of two feet in a couple of weeks. Its long fibers waving in the stream from either bank become entangled, and unless removed from time to time, chokes up the channel. A ditch less than a mile in length, near Tucson, requires the constant labor of one man to keep it clear of this intrusive fiber. The trouble, however, can be averted by turning the water off for a few days, when the burning sun quickly scorches the grass to death.

Land and Land Grabbing.

As before remarked, of the vast area of this Territory, but a diminutive fraction is suitable for grain raising in its natural state. There is much good land along the river valleys still open to pre-emption and entry under the Desert act, the most of it being desert land. Indeed, all that skirting the rivers for many miles where they run underground is, of course, worthless. Much of the land is too high for irrigation, even could the water be had; and still a great deal is in itself so sterile that no amount of water or culture could make it profitable. Land grabbing has not been indulged in here to any great extent, or any material profit as yet. In several cases the grabbers have quite overreached themselves by acquiring large tracts which were afterwards found to contain but a very small proportion of available soil; and they have discovered that it is possible to loose money on land even at two bits an acre. Those who think of settling here cannot be too strongly urged to examine carefully into the forgoing points—the idea prevailing to some extent that land which can be had for a trifle or nothing is better than no land at all. There are countless miles of country here that would break the capitalist who tried to work it, even if he got it for nothing. Still it must not be inferred that there are no lands left which can be acquired and worked to advantage; on the contrary, there are many opportunities for either colonies or individuals to settle here, and by industry and perseverance acquire a competence. The precautions to be observed are to get lands fertile in themselves, and which can be supplied with an abundance of water. Much of the choice land on the Santa Cruz and San Pedro rivers has already been pre-empted or taken under the Desert land act, but both the Salinas, or Salt as it is here called, as well as on the Gila river, there is much good land that can be had for the taking, and which could be cultivated to great profit.

Local Causes of Disease.

A disease of the same type, but differing in some respects from the ordinary chills and fever, is quite prevalent on the San Pedro and in other localities where the indigenous growth of cottonwood, willow gourd vines, and other vegetation is heavy and luxuriant. This is partly attributed to this fact that our two rainy seasons, in conjunction with the very warm weather, cause rapid and excessive decay of vegetable matter. It is believed that this sickness will diminish rather than increase as the native growths are rooted out and the land comes under careful and systematic cultivation, for in the older settled communities, such as Florence and Phœnix, both farming centers, this complaint is not prevalent. With this exception, the whole country may be regarded as one remarkably healthy, though

The Climate and Its Effects

Prove decidedly enervating to some constitutions, many being so overcome by it as to readily fall into idls and thriftless habits. This is very apt to happen with persons thrown much into the company of *Mexicans*, who form a large portion of the present population, and who, as a class, are but little in advance of the native Indians. Like the helpless shellfish they lie demurely waiting any morsel that the tide may bring them, actual starvation being the only thing that can stimulate them to exertion. To sit all day long in the shade, the first duty of life being rest and sleep, with a diet of jerked beef, chile pepper and unleavened bread; watermelons in season being considered luxuries, and his head wreathed in the smoke of his cigarita, is the highest happiness and chief aim in life with the natives of this country. When he has the ambition to try and raise a patch of grain he yokes two steers together by the horns, and uses a forked tree for a plow, cutting one prong short and sharpening it to scratch up the soil; the other being left long enough to form a tongue to reach to the yoke. The irrigation of the field is intrusted to a half-clad vagabond called a *peon*, who discharges his duties in a listless and slovenly way. When the crop requires to be harvested, he gathers a crowd, and with butcher-knives, swords and sickle, send them forth to gather the heads by hand into little piles of 10 or 15 pounds each. He then ties his steers to a dry raw-hide, skillfully turned up at the edges to form a drag or sled, and on this conveys the grain to a *patio* or yard carpeted with raw-hide, no modern innovation of thresher or sweat-producing flail being suffered to mar the primitive glory of the harvest. A herd of horses and cattle is turned in to tramp the grain and chaff asunder; after which, taking advantage of a windy day, the squaws winnow it with baskets. As soon as ready for market it is sold, even though it brings not more than enough to purchase a gaudy pair of pants to parade before the dark-eyed maidens of the neighboring village. Should the crop be a failure, then, with a sigh of relief at having escaped the toil of the harvest, he goes cheerfully to the task of devising ways and means to steal enough to tide over until the next season. When a white man has adopted the above, and sundry other customs peculiar to the Mexican, he is said to be "galvanized;" he who escapes this process being called a "tender-foot."

If, with all the disadvantages of crude and primitive farming, as above described, even the Mexicans and Indians can manage to get along here, it is certainly feasible for white men, with improved machinery, not only to live, but to make money at the same business. The arable lands are all level and of broad expanse, and well adapted to the use of machinery. "Lodging" and rust are troubles hardly known and heavy crops are a foregone conclusion wherever the land is properly tilled and the conditions are favorable to begin with. The expense of clearing land in most places is simply nothing, a heavy plow answering to grub up the sage brush, about the only shrubbery. Where the mesquit reaches the dimensions of a tree, the wood more than pays for its removal from the land. Although fencing is sometimes resorted to where the clearing of the land furnishes the material, it is by no means necessary, stock ranges being confined mostly to the mountain districts, where farming is impracticable.

As in California, many of the farms here are encumbered with mortgages, and their owners so burdened with debt that they find it difficult to make ends meet, being usually obliged to sell their crops as soon as harvested. Whether this be caused by shiftless habits or otherwise it is a thing deeply to be regretted, as it throws almost the entire profits of the business into the pockets of speculating merchants, who buy at harvest time and rarely fail to make a profit of 200% on their purchases before the end of the season.

Railroad Project in Tulare County.

EDITORS PRESS:—An important project is on foot to connect Grangeville with Hanford by rail, a distance of four miles. The single track railway, of which D. B. James, of Visalia, is the patentee, will be used. A trial of a good-sized working model of this road was made at Grangevills recently. On a short track laid for the purpose, a hand-car 3x7 feet was run by Mr. James. It carried eight sacks of barley and three large men, or some 1,300 pounds in all, and worked readily. A boy 14 years old could easily run it up or down the track. The track consists of two pieces of stout scantling laid side by side, leaving a deep groove between. A single row of wheels is used, the deep flanges of which run in this groove, broad rims of the wheels on each side running on the scantlings. Engine and cars are readily balanced. This is the same inveution that Governor Fremont proposes to introduce into Arizona. Citizens in and near Grangeville were so well satisfied with results that they determined to take steps to build and equip one mile of road running towards Hanford. A committee is now getting subscriptions to make up the $3,000 necessary for this object. It is estimated that this will secure an engine of sufficient power to haul 75 tons, provide a car or two needed for experiment, and build one mile of track. According to Mr. James' estimate the entire cost of each mile of track will be about $1,000. So that the three additional miles needed to reach Hanford will cost about $3,000 more, or a total cost of $6,000 for the four miles of road and equipments. This is one-sixth of the usual estimate at low figures for a narrow-gauge road in California. Cars are expected to cost as follows: Flats, $150; box cars, $250; passenger cars, $500 or $600. Such cars can be built to carry from 5 to 10 tons. It is believed that

A Speed of 25 Miles an Hour

Can be easily and safely made on such a road. They expect to have this first mile in running order within 60 days from the time the $3,000 in stock is subscribed. Should the four miles proposed prove such a success as is anticipated, the projectors then propose to extend the road across King's river and on the west side of the San Joaquin down to Antioch. It is calculated that a road of this kind for that distance—about 180 miles—can be built and equipped for less than $250,000. What a great relief this would be to the farmers and other shippers of this valley, on the vital question of transportation.

J. W. A. W.

Hanford, Cal.

DEPTH OF EARTHQUAKES.—The recent earthquake at Virginia City was not noticed at all in the mining depths, but only by people on the surface. Their famous earthquake of some years ago, which shook down chimneys, fire walls, cracked brick buildings, and did other damage, was merely noticed by some of the miners working in the upper levels, but it did no damage, not even shaking down loose stones and earth. The station men in the various shafts felt it the strongest, and the deepest point where it was noticed was by the station tender at the 900-foot level of the Imperial-Empire shaft—900 feet below the surface. He said it felt like a sudden faint throb or pulsation of the air, as though a blast had been let off somewhere at a distance, above, below or in some indefinite direction. In some of the mines the shock was not noticed at all, even by the station men. Commenting on this peculiar fact at the time, the Gold Hill *News* remarked that the earthquake seemed to be an electrical disturbance proceeding from the atmosphere and not from the depths of the earth.

TROUBLE AHEAD.—Utah is threatened with a drouth such as it has not seen for more than a score of years. The spring has passed with only a single shower and there was less snow on the mountains on the first of April than the oldest inhabitant remembers to have seen. The Sevier river which in May, as a rule, is full to the top of its banks, is reported dry in Millard county. Iron and Beaver counties it is feared will not have sufficient water to save the growing crops, while the vineyards in Washington and Kane counties are in danger of being dried up.

The Great Railroad Strife.

Within the undeveloped region lying west and southwest of the Mississippi river is to occur an activity for the next 25 years of which that on the Pacific coast will prove to have been but the precursor. The Atchison, Topeka and Santa Fe railroad, now traversing Kansas, Colorado and New Mexico, is to be a transcontinental road, with an outlet at Guaymas, on the Gulf of California. The Southern Pacific railroad is to be another. One is pushing on with all possible speed westward, and the other is coming east at the same rate, and having already advanced nearly 200 miles into Arizona, will be at El Paso, 500 miles eastward, by next year. From both of these trunk roads there will necessarily be laterals, or feeders, running north and south, and having for their grand ultimatum the control of the trade with Mexico. The 8,000,000 of people inhabiting that country will naturally prefer a close commercial intercourse with the United States, which they will have by railroad connection such as the current schemes involve, to the slow, costly and circuitous intercourse by sea with England and Germany. The Union Pacific and Kansas Pacific railroads are headed off by the superior activity of the Atchison, Topeka and Santa Fe, which has already pushed down to Las Vegas in New Mexico, and will be at Albuquerque before the close of the year. This road has absorbed the Denver and Rio Grande narrow-gauge, and will make its rapid way through New Mexico into Arizona to Tucson, at the lower end of the Santa Cruz valley, where it will meet the Southern Pacific, already nearly at that point, on its way to El Paso. From Tucson the route will be south, up the Santa Cruz valley and through Sonora to Guaymas, on the Gulf of California.

At the head of this rich valley, and in the center of the vast district whose mineral products are soon to astonish the world with their vastness, is located the incipient City of Calabases, yet to be known to fame. Through this city, whose climate is described as that of Italy, the Southern Pacific will unquestionably pass on its eastern way from Tucson to El Paso in New Mexico, while the Atchison, Topeka and Santa Fe road, taking a more comprehensive name as it enters Arizona, will construct the Mexican and Guaymas railroad through the same valley and city into Sonora to the Gulf of California at Guaymas. That will constitute its base line of operations in moving upon Mexico and its trade. Millions of dollars worth of trade passes up and down that valley to and from Sonora to-day. The concealed but well-known mineral wealth of Arizona, then, together with the rich traffic of Mexico, being the objective point and grand aim of these two transcontinental roads, it is natural that each should struggle with all its might to see which shall occupy the commanding position in the coveted field. The route known as the 32d parallel is, as it has been from the beginning, the object of desire among powerful railroad corporations. The Southern Pacific likewise threatens the Union Pacific in its current designs. The owners of the Central Pacific are the builders of the new Southern Pacific. In order, therefore, to obtain a southern outlet on the Pacific, instead of being limited to the one now granted it by the Central, the Union Pacific will push the Utah Southern road southward across Central Arizona to San Diego, which is one of the only three great Pacific harbors belonging to the United States. This will make transcontinental routs number three. Thus will the Union Pacific break away from the restraints of the Central Pacific, and the latter, owning the Southern Pacific, will escape from those of the Union Pacific, on its way east.—*Boston Post.*

NARROW-GAUGE.—It is a pretty well settled fact that a narrow-gauge railroad is to be run from Maricopa to Prescott. It will undoubtedly take in Phœnix, from which place the "knowing ones" seem to think the road will come by way of Wickenhurg, and thence on through Peoples, Kirkland and Skull valleys. It is understood that Eastern capitalists will take the matter in hand and commence the erection of this much-needed road at once. So soon as Prescott is connected with the outside world, by rail, one may expect to see business revive and a new state of affairs reign. When capitalists can jump aboard the iron horse and be hurled over the continent with ease and luxury to the very doors of their mines, then Arizona may look for that class of people within her borders. If they have not the water wherewith to work vast reduction works at home, the mineral-perforated ores can cheaply be carried away to the Salt River valley, where an abundance of water and wood abounds. Machinery and supplies can be landed at a much less figure than at present; wool, hides, lumber and other products can be shipped cheaply and quickly to market. Prescott, with a terminus wherein would be built round-houses, machine shops, depots, would step to the front and become the liveliest city east of San Francisco, and her people would awake in a few months and find themselves surrounded by wealth and everything else pleasant.

A CURIOUS ancient Mexican library has been found in the ruins of a vast palace at Xayi, near Chiapas, in southern Mexico. The writings are inscribed on terra-cotta tablets, half an inch thick, and are supposed to be sacred records, but the language in which they are written is not accurately known.—*L. A. Commercial.*

MECHANICAL PROGRESS.

Preserving Timber by the Hayford Process a Failure.

Whatever may be thought of ths merits of infusing creosote, sometimes called carbolic acid, into the fiber of timbsr for its preservatiou, we know that either the material or the method adopted to infuse it into the pores of the wood used in the construction of the U. S. S. *Vandalia*, was a total failurs. In some cases the strength was so completely destroyed that planks broke into two lengths while being trasported on men's shoulders from the tank to ths vessel.

The effect of the infusion of this material into the fiber of green timber, on its etrength, seems never to havs been thought of, much less tested. So far as observation could dstermine, the strength was impaired in the ratio of about the amouut of material infused. It was fouud by tbe workmen, who left their dinner baskets standieg in contact with the timbor so treated on the *Vandalia*, from roll-call to dinner time, that the food had acquired a greenish hue, and could not he eatsn. The most sensible method of ssasoning timber, so as to make it durahle, is to extract the poisonons juices drawn up into the fiber by capillary attraction. If this is properly done the timher will he stronger than when in its green state. There are several methods by which this desirahls end may he secured, at reasoeahls cost, and the timber made secure agaiest rot for the third of a centnry, at least.—*American Ship.*

To Temper Mill Picks.—1. Take two gallons rain water, one ounce of corrosive sublimate, one of sal-ammoniac, one of saltpcter, onc and one-half pints of rock salt. The picks should he heatcd to a cherry red and cooled iu the hath. Ths salt gives hardoess, and the other iegredients toughness to the steel; and thsy will not break if they are left without drawing ths temper. 2. After workieg the steel carefully, prepare a bath of lead beated to the boiling point, which will be indicated by a slight agitation of the surface. In it place the end of the pick to the depth of one and one-hali inchee until heated to the temperature of the lead, then pluegs immediately in clear cold water. Ths temper will be just right if the bath is at the temperaturs required. The principal requisites in making mill picke are: First, get good steel. Second, work it at a low heat; most hlacksmiths injure eteel hy overheating. Third, beat for tempering without direct exposure to the fire. The lead bath acts merely as a protsction against ths hsat, which is almost always too great to temper well.

Tin plate manufacture hids fair to soon become an important industry in the United States. A largs establishment has recently heen estahlished in New York, and is now known as the Monitor Tin Plate Company. It occupies a building in Horatio strest, where the tinning is done; but the iron is rolled at a mill in Pittshurg. The tinning house is 100 feet square, fitted with every modern appliance. The sheets are rolled in the ordinary way, then cut or sheared to size, and immerssd in a pickling bath. They are thsn cold-rolled again, annealed and pickeled, and put into haths of Russian tallow or palm oil. Then thsy pass through several baths of tin melted at a high temperature, and again through sawdust and bran to cleanse the surfacs. Finally, they are polished with lamb's wool huffers, and assorted, ready for boxing and shipping. The annual amount of tin plates imported into the United States in 1873, reached the large sum of a fraction short of $15,000,000.

Railway Notes.—Since the huilding of the Mount Washington railway eight similar roads have been constructed in Austria and Switzerland. The engines for these roade were firet built with vertical boilers; nsxt with hoilers that were level on an averags grade; now they are built with horizontal hoilers like ordinary locomotives. Various methods have heen devised for enabling the locomotives to work hy adhesion of their smooth wheels, as well as by means of their cog-wheel drivers, and by means of eithsr at will. No one of these has heen permanently successful, however, so that the proper construction of a double engine of this sort is still a matter of experimental inquiry.—*Scientific American.*

A New Steam-Proof Cement.—*Dingler's Polytechnic Journal* gives a description of the manufacture of a new steam-proof cement, discovered by Mr. A. C. Fox, which, it is claimed, is not affected hy hot or cold water, nor by acids or alkalis. First, a chromium preparation is mads in the following manner: 2.5 parts, by weight, of chromic acid ars dissolved in a mixture of 15 parts of water and 15 parts of ammonia. To this solution ahout 10 drops of sulphuric acid, and, finally, 30 parts of sulphate of ammonia and 4 parts of fine white paper, are added. When ahout to be used, gelatine diesolved iu dilute acetic acid is added.

Paper Bricks.—A manufactory of paper bricke has been etarted in Wieconsin. Ths bricks are eaid to be exceedingly dnrable and moisture-proof. They are also larger than the clay article. What next?

Iron Fencino.—It is almost nnnecessary to speak of the advantages which irou fencing possesses ovsr that which did duty in the days of our fatbers. These are so well known that to recapitulate them would be like telliog a twics-told tale. The only qnestion is to ascertain the best kied of iron fencieg to adopt. Specially valuahle is that which is made augular and coetiuuous. Much experience has led to the coeclusion that angular iron is a good deal stronger than a solid plats of the same wsight, and, therefors, better adapted for contiuuous iron fencing thau flat hars. Strength, of course, is a most important item in deciding upon fencieg; but this is not the only advantage. Each bar, for instance, being solid, without joint or weld, it cannot be broken at the ground line. No holes have to be dug, for the staedards are driveu direct to the ground, and ars tbers securely fixed; thus they ars very easily erected. Moreover, the upright bar heiug broader, the feucing can be distinctly seen by horses and cattle, and thus the risk of stock runuieg against it is considerably reduced.

Home-Made Drill Rous.—The *Iron Aye* says: Until witbin a few mouths, the successful manufacture of flee drill rods and compressed wire has been carried on exclusivcly abroad. Recently Messrs. Miller, Motcalf & Parkiu, of Pittsburg, have secured the exclusivs control of the necessary machieery for tbe maeufacture of these articles, and have succeeded in producing an article excellent in accuracy, finish and quality. They manufacture all sizes, from No. 60 to ½-inch, and have lately perfected machinery to finish sizes up to 1½ inches. We helieve these large sizes havs never been prodnced, and it will certaiely be of interest to manufacturers of fine machinery to know that this material can he obtained at home without the delay attending foreign orders. The accuracy and finish required by tho trade in this product, which must not be confounded with drawn wire, ie surprising. Ths compression to which it is snhjected perfects the finish and adds to the value of the hne steel from which it ie made.

Improvement in Railroad Locomotion.—The obstaclee in the way of ths use of light locomotives have, it is claimed, been met in a measure by recent inventions of Mr. Georgs French, of New York city, which ars iutended to increase the adhesion of light eugiees without adding to their weight. One of the inventions, intended for engiues of mogul pattern, doce not chaege the general construction, hut adds to the trailing wheels a pair of grooved tires, the groovs heing just deep enough to firmly grasp the head of the rail. These wheels do not rest upon the track in the regular work of the engine, but when it is necessary to increase the adhesion, as upon an up-grade, they are lowered, and the head of the rail is grasped in the grooves of the wheel. It is claimed that this arrangement gives all the adhesion needed.

Making Spikes by Machinery.—One of the most interesting sights seen by the mining engineers in their recent excursions about Pittsburg, Pa., was the continuous rolling mill, and ths spike machines at Dilworth, Porter & Co.'s. A billet of iron ahout 5 feet long and 2 inches square enters the rolls and is carried directly through ten paire of horizontal rolls placed one in front of the other, revolving at successively increasing speeds, and emerges in the shape of a long rod ahout half an inch square. Ths rode are carried without further heating to four epike machines, each of which turns out a complets spike in ahout a second of time. There is scarcely any operation in the manufacture of iron specialties which is so well done entirely by machinery and without any skilled lahor.

Compressing Liquid Metal.—We have already alluded, in these columns, to the importance of compressing metals while in a liquid state, to increase their strength when cold. A late number of *Von Nostrand's Magazine* contains a lengthy article on this important practical fact, in which the writer thinks ths practice of casting undcr pressure is likely to be extensively adopted in the manufacture of steel. Ths process of cold-rolling has been found to increase the strength of bar iron in some cases as much as 100%.

Cheap Steel.—The London *Times* remarks that "the Bessemer process has ruined the manufactured iron trade." But it has done more than this; it has distributed among many countries the mannfactors of cheap eteel, and thus enabled them to supply more fully their own metallurgical wants and the metallurgical wants of other countries, in lieu of their own previous partial dependsnce upon Great Britain for both iron and eteel products.

Boots and Shoes with Stone Soles.—The *Engineer* states that a German inventor proposes to make boote with stone soles in the following manner: He mixes a suitahle quantity of clean quartz sand with a water-proof glue, and spreads it on a thin leather eole, which ie employed as a foundation. These quartz soles are said to he flexible and almost indestructible, while they enahle the wearer to walk safely over slippery roads.

Improvements in the Steam Engine.—Daney etatee that future improvement of the steam engine muet be in ths direction of remedying the following defects: The present emall ranges of temperature, the waste of heat by radiation, the too ready heating and cooling of the cylinders and pistone, and mechanical inaccuracy.

SCIENTIFIC PROGRESS.

Intra-Mercurial Planets.—Camille Flammarion, the well-knowu French astronomer, has heen examining iu *La Nature* tbe evidences in favor of iutra-Msrcurial planets, and particularly that furnished hy Watsou & Swift. Ou the latter M. Flammarion says: "While it is possible that the American observers saw ae iutra-Mercurial planet, or sven two, we cauot, in view of tho special difficulties of the situation, the confusion of the figures, aud the negativs observations of the ether observers, coucede it to he an absolute and incoutestahle fact that they saw even so much as ons. The fact is not yet certain." After reviewiug the wbols testimony thus far available on this interesting point, the French writer sums up as follows: "The hypothesis of a siegle body comparable to Mercury gravitatiug iu closs proximity to the sun and on a plane probahly iuclieed to the eolar equator seems to us to be so open to objections as to he nutenable. Still, the mathematical theory of universal attraction proves that there is a cause for the retardation observed in the motiou of Mercury, and that this cause cannot be found hy augmentieg the mass of Vcous—a quantity now determined with great exactitude—hut must be sought for in some disturhing mass between Mercury and the snn. But this mass may not be a planet worthy of the name of planet; it may consist of a great number of asteroids like the miuute fragments which gravitats between Mars and Jupiter—astsroids so small tbat oftentimes they escape the notice of observers of the eun and of cclipses, though eome of them may he large enough to hs seen under certain rars conditioes. Ths latter theory is the one which we adopt."

A New Refrigeratino Liquid from Beets. In Europe the principal supply of sugar is derived from beets; the annual production of beet eugar heing now 700,000 tons. Besides this a large quantity of heet molasses is produced, a portion of which ie distilled and a coarss sort of whisky made; the stuff remaining in ths retort yields potassium salts, which are employed as fertilizers. Sugar, spirits, and potash have heretofore been the chief products manufactured from beets. But Mr. Vincent has now succeeded in rsalizing from the refuse that remains after the heet molasses distillation, a combustihle, gaseoue body, which is easily condensed into liquid form, and is called chloride of methyl. Thie liqnid, ohtained as stated from heets, is used in tbe preparation of some of the anilins colors; hut it is now found to be especially valuahle as a refrigsrating agent. By its rapid evaporation a temperaturs of 55° C., or 67° Fahr. below zero, may he maintained, which is far below the freezing point of mercury. Prof. Huxley says that by this means mercury (which freezes at 39° Fabr. below zero) may be frozen hy the pound. For the manufacture of ice tbis new beet root product promises to hecome of much importance.—*Sci. Am.*

Malleable Nickel and Cobalt.—Fleitmann bas succeeded, by a very simple device, in obtaining cast nickel in a malleable and ductile form, even when cold, while cohalt prepared in the same manner possessed such hardness when cold, that he expects it can he used for cutting instruments, while hot it is hoth malleable and ductile. His process consists in adding to the fused metal, through a hole in the lid of the crucihles, one-eighth per cent. of metallic magnesium, which possesses a remarkahle power of deetroying carhonic oxide. The author is of the opinion that ths porous and crystalline character of cast nickel is due to its absorption of carhonic oxide gas while in a molten state. It is not impossible, however, that owing to the great affinity of magnesium for nitrogen, its action may he due to the destruction of cyanogen in ths metal. Cobalt prepared in this manner possessed none of the reddish color attributed to it in the text-hooks, hut actually excelled nickel in whiteness and brilliancy. He also welded these metals on to iron and steal at a whits hsat, and strips thus welded were rolled out to the finest number without scparating from each other.—*Berichte d. d. ch. Ges.*

Nitrous Oxide under Pressure.—P. Bert finds that by placing a patient in an apparatus where the pressure can be increased to two atmospheres, nitrous oxide can be administered so as to produce continued anæsthesis, while the hlood receives its normal snpply of oxygen and the normal conditions of respiration are maintained. From various experiments on auimals, hs thinks that gas administered in this way will he harmless, however much the insensibility may be prolonged.—*Comptes Rendus.*

Further researchss on the compressibility of gases ars communicated to the French Academy by M. Cailletst, who makes the anouncement that nitrogen does not exactly follow Mariotte's law. He announces, from his observations, that thie gas is at first more compressible than the law would indicate, and that then its compressibility diminiehes, as he observed to be the case witb atmospheric air. The gas preeents this maximum at a pressure of 70 metere of mercury.

M. S. Mesinier hae made mixtures of iron and nickel chloridee, reduced by hydrogen at a red heat, yield well-defined alloys, sometimes admirably cryetalline, and closely analogoue to the meteoritic alloye of iron and nickel.

Curious Phenomena of Reflection.—The *Engineer* publishes ae interesting paper by Mr. Robert Mallet on sons curious phenomena of reflectiou, which, hs observes, may give a cue to the explanation of the magic mirrors of Japan. Many years ago Mr. Reeks, of ths London School of Mines, noticed that the image reflected in bright suulight from a silver coiu, which hy abrasion of wear had become practically flat, and from which all traces of image and superscriptiou had vauisbed, was different, in the intensity of the light reflected, from what had ouce been the field or depressed part aud from the head. A silver half crown was struck at the Royal mint showieg the Queen's head on the ohverse side, but without any design on the reverse face, where a flat surface of polished steel was placed in the coining press ie place of the usual reverse die. When this flat and polished side was exposed obliquely to bright sunlight, ths reflected image thrown upon a flat surface not only preseutsd witb much distinctnessaud accuracy the outline of ths head, but also a portiou of the "Victoria" surrounding it, the head aud inscription beieg shown by a far more brilliant light than the rest. This suggests some interesting inquiries iu regard to the flow of metals.

A New Nebula and a Lost Planet.—Dr. Temple, of the Observatory of Arcstri, Floreuce, announces his discovery, on March 14th, of a new neubla, which he at first mistook for a faiut comet. Ite position for 1879 is R. A., 11h., 18min., 5scc., N. P. D., 86° 1'-4. Dr. Temple describes it as a doubls nehula with two small but distinct nuclei from 15" to 20" apart, and he adds that nebula Herschel II. 32, which is in the vicinity, is much smaller and faieter than the one just discovered. It occasionally happens that celestial bodies are lost as well as found. This has occurred several times in ths case of the small planets between Mars and Jupiter, which now number nearly 200. There is oue of these, howsver, which, according to Mr. Proetor, astronomers would regret to lose. This is the planet Hilda, which travels in a much wider orhit than any of the others, and can give mors exact informatiou respecting the mass of Jupiter thau any other member of the solar system, comiug much more fully at certain times nuder his iufluence. Unfortunately, Hilda has been searched for in vain at its first return to opposition, and astronomers begin to fear that the planet is, for the time being, lost.

Is Condensed Steam Explosive?—Ths following appears in a Boston daily paper: To economizs heat, it is common to pass ths steam from the cylinder to the tender in a locomotive, to be used again and again. A similar process through the condenser is in vogue on hoard of steamers. For some time Mr. R. C. Blackall, Superintendent of the motive power of the Delaware and Hudson R. Co., has beeu experimenting with this condensed steam, and among other important discoveries, has found that it becomes highly explosive without giving any warning, under certain circumstances, which are liable to occur at any time. He thiuks it probable that some of the missiug ocean steamers have heen hlown up by condeesed steam. Locomotives, he contends, are exposed to the same danger. Now if this is so, Mr. Blackall ought to make it known as extensively as possihle for the safety of life and property.

The perforation of marble by a marine borieg animal (the sponge known as *Cliona sulphurea*) is a novsl fact observed and noted by Prof. Verrill. The facts in ths cass are briefly as follows: A vessel laden with Italian marble was wrecked in 1871, off Long Island, and the exposed portions of ths slabs which occasionally coms to light, are found to he thoroughly penetrated to the depth of an inch or two hy the crooked, irsgular borings of this sponge, and reduced to a complete honeycomb, readily crumhled between the fingers. Beyond these borings the stone is still perfectly sound and unaltered. Prof. Verrill notices this as the first instance recorded where this sponge has attacked limestone, since calcareous rocks do not occur along the portions of our coast inhahited hy it; and he suggests that its demonstrated ability to destroy such rocks so rapidly might have an important practical bearing on the use of limestone structures for submarine works.

Newly Discoveren Fossil Bird Tracks.—The lower Connecticut valley seems to be quits as full of giant fossil bird tracks, in stons, as the upper region about Turner falls, where Prof. Hitchcock made his discoveries. Messrs. Coe & Fowler have just uncovered, in their quarry on Powder hill, half a mile west of the Middlefield and Durham station, a layer of stone indented several inches with bird tracks. Several on a line are thres and one-half feet from each other, and measurs fourteen inches on the center claw, and outside claws heing separated about a foot at the points. These tracks were made in the mud and oozs of a shore that was evidently washed by the tides, and each incoming tids deposited a layer of silt, or mud, which hecame sufficiently hardeued in the sun to retain the form of the impression, and in that ehape ths mud was slowly turned to freestone.—*Hartford, Conn., Times.*

Another New Planet.—The Smithsonian Institution reports, under date of May 23d, the discovery of a new planet of the 12th magnitude. It was discovered, according to the announcement of the Observatory of Paris, by Palisa, at Pola.

Mining Share Market.

In spite of the fluctuations of the stock market, there is a general feeling that a good market exists, and that the tendency is towards improvement. With an upward tendency early in the week, a slight decline was experienced toward the close. The cause originates in the contest between Comstock and Bodie. In this contest between really notorious interests, it is to be hoped that wildcat and comparatively worthless stocks will be crowded out. These are naturally more active and seductive when leading stocks decline, because of some interior commotion. It cannot be denied that the market shows feverish symptoms, but there need not be any apprehensions on this account, indeed, with the disappearance of the symptoms a healthy re-action will set in, and an active market is anticipated within the next 50 days. The immediate future is rendered more forbidding by the bears, who luckily took the market at its ebb. The rapidly increasing demand for stocks of the Bodie district, caused by the flow of Eastern capital in that direction, causes the manipulation of other stocks to create a diversion in their direction. The attempt of any person to depress our stocks in the East, particularly of the hydraulic and quartz mines, will have no other than a good effect, contrary of course to his intention, in that the extravagance of his assertions will excite inquiry among Eastern capitalists, which can have only one result, viz., satisfactory reports and further investments. New and paying gold mines are being opened in greater number in this State now than at any other time, and in our recent districts we believe there is more wealth in sight than ever before. We must, however, caution our readers against false appearances. In all business enterprises there is bad mingled with good. But a wise determination to examine before investing, will relieve all from the odium of being classed among those credulous ones who seem born to be relieved of their coin by skillful and unprincipled manipulators. The transactions of the Board for the past week may be set down at an aggregate of $3,500,000. Small, of course, in comparison to the activity of former periods. It may be that not one-tenth are *bona fide* sales. So we warn our readers that wildcats seem to monopolize the business at present, and that assessments are being freely levied. And to cautiously draw the line between the value of the mine, and the unprincipled manipulation of the stock.

In Sumatra, when telegraph messages are delayed or fail to be transmitted, it is because the wires are down or won't work, as elsewhere, but it is not attributed to storms. Elephants and tigers upset the poles and monkeys break the wires by taking gymnastic exercises on them.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

The Kelly Mine.—*Dispatch*, June 7: Mr. Owen Kelly, proprietor of the Kelly mine, on Murphy's ridge (formerly known as the McKay & Love mine), will commence work next Monday, running the tunnel in 100 ft further, where he expects to strike the main ledge. The tunnel is already in about 400 ft, and will therefore be about 500 ft in length when completed. He expects to reach the ledge in about six weeks.

From Amador City.—A very serious accident occurred at the Keystone mine last Wednesday, by which two miners, named Angelo Bruno and John Kernick, were seriously injured—the former probably fatally. While drilling a blast hole an old Giant powder cartridge was struck by the drill and exploded.

Hauling Rock. Messrs. Marshall, Lorraine & Quester are engaged in hauling about 150 tons of rock from their mine, near the Gate, to the Moore mill, to be crushed as a test. It is expected that it will yield a rich return.

Moore.—*Ledger*, June 7: A mishap of a serious nature occurred at this mine last Monday. It must be remembered that to the depth of 200 ft the shaft is an old one. When the water was taken out by the present company it was thought unnecessary to retimber the shaft below water level, as the old timbering was found to be comparatively sound. Atmospheric influences, however, since the shaft has been drained, have caused rapid decay. The company being short of means, naturally staved off the work of retimbering as long as possible. On Monday the timbers gave way, stopping all work in the levels. The extent of the disaster is not exactly known; as although the opening is not entirely closed at any point, which is proven by the pump working freely, still entrance through the shaft is too dangerous to be thought of. The general impression seems to be that the 70 ft of new shaft, sunk by the present company, is uninjured, but that the old shaft will have to be retimbered all the way, except perhaps a few ft from the surface. Retimbering was commenced on Tuesday. It will take probably six weeks to put the shaft in good order. The dump was exhausted of rock Monday night, since which time the mill has been running on ore from a claim at Jackson Gate.

Monterichard.—This mine is in a very prosperous condition. A clean-up was made this week, which yielded about $1,500 over expenses. The liabilities of the company are being gradually liquidated. It is expected that by the end of summer, if the rock continues to yield as at present, the company will be entirely free from debt. The ore body continues small, but improves in quality. The last run was the best yet made.

Miscellaneous.—The clean-up at the Downs' mine, made a few days ago, panned out $25 per ton. While this is a splendid yield, still it is less than the average rock taken from this mine. The decreased yield is accounted for by the fact that the ore of late has come from stopes near the surface, and it has been the experience in connection with the claim, that the ore has improved in quality with increasing depth. The Talisman mine and mill are both idle. Beyond the taking out of water, there is nothing going on around the works. Parties are negotiating for the purchase of a controlling interest in the Eclipse mine, at Amador City. If the sale is consummated, and there is every reason to believe that it will be, active operations will commence almost immediately. Both the Gover and Bunker Hill mines are passing through a period of depression. The yield lately has been barely sufficient to pay expenses. At the Pennsylvania mine, New Chicago, the indications point to a protracted period of idleness. The wood and other material about the works have been sold. They are negotiating with J. R. Johns for the sale of the hoisting and other machinery, and it is understood that if a sale cannot be effected, most of the works will be sent away to Fresno county. Twelve men are employed on the Maryland and Seaton mines. Charley Peters, on Thursday, shipped a couple of tons of quartz from the Goop Hope mine, in Jackson, to Sacramento, to be treated by the Roberts process.

CALAVERAS.

West Point.—*Citizen*, June 7: In and around West Point, summer is on hand, the mercury rising to 00° and over. Haying is just beginning, with prospects for a fair and over an average yield, and in consequence there will not be much mining for the next few weeks. The quartz mills, however, are all busy and will continue working until water gives out in the fall.

EL DORADO.

The Black Rock Mine.—*Democrat*, June 7: Superintendent John Sipp informs us that a crushing of rock recently made turned out splendidly. The mine is now equipped with a five-stamp mill, which takes the place of the French burr-stones originally tried, and work will be pushed right along. Both ledges are developing first-rate.

E. D. W. & D. G. M. Co.—This company is now working the White Rock, Reservoir Hill, Loomis and North Excelsior mines, besides furnishing water to wash tailings in Spanish ravine and in the creek on the Bush Dickson ranch. They expect soon to have employment for all the water they can bring down.

Robertson Process.—A lot of 10 tons from the Gold Deposit mine, near Kelsey, is to be tested, of which a portion has already been shipped. Also 10 tons from the Rose mine, this city, for which Mr. Parkinson gave Mr. Brewster $15 per ton at the mine, that being the full amount which Mr. Brewster claimed that he could net by milling it, and Mr. Parkinson sends it below at his own risk and as a speculation from which he is sanguine of realizing a handsome profit. An arrangement is reported, by the terms of which he engages to take the entire product of the Rose mine at the above figure.

MONO.

Placer Gold.—*News*, June 5: Our reporter was this morning shown a beautiful little bar of placer gold, taken out of one of the claims immediately above the schoolhouse. Its weight was 15 ounces and its value about $14 per ounce, or $210. This was the result of about 15 days' work on the part of two men. Nearly half the time they were without water. Were it not for this drawback, a good deal of money would be taken out of the placers. The same parties a few days ago had a bar of $60.40.

The Dudley Mine.—Connection has been made between the 300 level and the old tunnel workings by means of the upraise, and drifts north and south are being run in the ore body, preparatory to stoping. The drift is now about 60 ft in length. The richer ore, which has many of the characteristics of that of the Bodie in color as well as in other respects, is being carefully sacked. The pump will soon be here, when sinking the main shaft will be resumed.

Pontiac and South Bonanza.—The Pontiac and South Bonanza ledges were located south from the Richer mine, by some Italian boys, a short time ago, and has been quietly and persistently worked on since its discovery. Yesterday, Al Morgan and Charles A. Looso, who have been working the case up, completed a bond on both mines, with the privilege of commencing work upon the property at once. The developments made thus far, have been made by means of a shaft down 30 ft, and a tunnel run in on the slope of the mountain to connect with the shaft. We were shown an average of assays of rock, taken from different portions of the mine, which shows a result of $77 per ton in gold and silver, mostly silver. Work will be at once commenced on this valuable property, and as it has, thus far, produced paying ore from a vein averaging three and one-half ft in width, which continues from the grass roots, we consider it a good milling proposition from the start. The discovery of the ledge will go far toward reviving confidence in the value of south-end properties, and make assured the theory that the ore channel extending through Bodie bluff, Silver hill and Queen Bee hill, is continuous and unbroken. We regard the work to be done upon this mine as being of the utmost importance in adding strength to the kindly feeling already existing toward the south end, and look for most cheering reports from that locality. The rich ore found in the two mines named will cause prospectors to thoroughly examine contiguous ground, and the result will be discoveries of more and valuable ledges still further south. We are of opinion that the mineral belt extends through the whole country from Aurora to Lake district, and that, ere another year has passed, Mono county will have assumed a rank second to no other mining country in the world. We have the mines and will soon have men with capital willing to invest, who will soon make the southern end of the lode as notorious as the famous Standard and Bodie now are.

Bullion Shipments.—*Standard*, June 5: From the 1st to the 5th of June the Standard Con. has shipped two bars of bullion, through Wells, Fargo & Co., as follows: No. 132, $21,102 34; No. 133, $20,761.57; total, $41,053.91. Bar No. 133 closes the shipment of the Standard Con., on account of the fiscal month of May, with a total of $114,951.81. We yesterday mentioned the shipment of Noonday bar No. 3, amounting to $4,070.50. The total shipments from the 1st to the 5th of June would, then, be as follows: Standard, $41,053 91; Noonday, $4,070.59; total, $40,033.50. Before the close of the present month, we expect to see the ranks of the bullion-shipping mines receive a lively recruit, in a no less important mine than the Bodie.

Red Cloud.—Running a crosscut east on the 400 level to cut the Westchester ledge. Have made 30 ft within the week passed, and the character of rock has a favorable look. A contract has been let beginning at the extreme south end of the south drift of the 250 level in the Red Cloud. Everything about the mine and works in magnificent condition.

PLACER.

Items.—*Herald*, June 7: We learn that gravel that pays $25 per day to the man has been struck in a mine located in El Dorado canyon, a little above Sunny South, in which our friends Ed. Polifka and E. L. Dooley are interested. Who the other owners are we have not heard, though, doubtless, they are parties mostly residing in that locality. Pending particulars, we say, bully for the boys. We were shown a prospect yesterday, from one pan of dirt taken from Stuart & Low's mine, located a mile or two below Auburn, which was very flattering, indeed, there being in the pan not less than $3 or $4. Mr. J. R. Nickerson brought into our office on last Wednesday a large specimen of copper ore which he had taken from his claim, which is located on Bear river, near the mouth of Wolf creek, Nevada county. This specimen was taken from four ft beneath the surface, and is said to contain from 60% to 80% of pure copper, and is a fair specimen of the entire ledge, which is 34 ft wide. Mr. Nickerson has been laboring under adverse circumstances in the opening of his mine, but the dark shadows that have hitherto clouded his future are giving way, and a brighter prospect presents itself. He feels fully confident with his mine thoroughly developed his most sanguine anticipations will be realized.

American River Mining.—Mr. Chapman, superintendent of the American River Dredging and Mining Co., is making active preparations for commencing the season's operations. Last summer was spent mostly in building the boat and getting the machinery in place. Some work was done before the rains swelled the river, though not enough, hardly, to fairly test the richness of the ground. The machinery and dredger, we understand, worked most admirably, and the gravel taken up from the river bed, toward the last, paid unusually well. The very last run made last fall, some $50 was realized in a few minutes. With these encouraging signs, the company enter on their work this season with naturally bright anticipations.

Dutch Flat Items.—*Forum*, June 5: Last week the Southern Cross cleaned up between $5,000 and $6,000. Paid off last Monday. The claim has enough ground broken up to make another run, which, it is expected, will pay better than ever. The Polar Star has commenced to clean up. The Franklin mine, under the superintendence of E. Miner, is pushing forward the work of a new drift, and will burn 500 pounds of powder as soon as it is completed. The mines at Oold Run are all running on full time and with good prospect. The Big Bonanza, owned by the Towle Bros., J. L. Gould and Col. J. F. Moody, work 25 to 30 men night and day, and are using about 1,500 inches of water. The Cedar claim is also running on full time—about 15 men are employed night and day. The mine prospects well and good results are anticipated. Work on the El Capitan mine has been progressing favorably. The incline is down 42 ft, and water struck which will delay further sinking until machinery can be erected. In the meantime the workingmen will be kept busy taking out ore. Talbot's blue gravel claim at the head of Oold Flat is looking well. The channel has been prospected for a distance of 200 ft on the line, and is opened up for about 600 ft. The Badger Hill company, near Cherokee, cleaned up a few days since, and the result was very satisfactory. The Eureka Lake Con. mine, at Columbia Hill, made a good clean-up last week. The tunnel of the Planet gravel mine is now in a distance of 1770 ft. Of late the ground has been harder and progress slower, but the location of the gravel channel is known, and it will be reached before many weeks. Thomas Ewving has been appointed superintendent of the Murchie quartz mine, vice M. Oarver, resigned. The Pittsburg is doing finely under Captain White's superintendence. The ore bodies are enlarging in most directions. There is also a decided improvement taking place in the grade of the ore. In the Idaho mine, during the past month the drift in No. 11 level, 180 ft below the 10th level, has been extended 15 ft, making the distance opened on the level 35 ft. The ledge is strong four ft, and the character of the rock continues to improve as the drift goes eastward. The distance yet to run to get the regular pay chute that goes down from the 10th level is estimated at from 50 to 60 ft. When this point is reached the usual high-grade rock of the wonderful pay chute, for which the Idaho has been so long famous, will be entered upon. On the 10th level the drift is in 480 ft east of the new incline, carrying a four-ft vein of good pay ore. On the 9th level, some distance east of the new incline, the vein has been cut out by a horse, but it is expected that the ledge will come in again any day, as on the 8th level the ledge holds regularly at a point further east than the 0th level has been driven. The air shaft that is being sunk and raised in the eastern part of the mine, lacks but 202 ft of a through connection down to the 10th level. The Oodfrey mine produced a beautiful bar of gold worth $1,150 from last week's run. Scadden Flat now has 50 men on its pay roll, and besides there are 10 tributers at work. A clean-up on Monday of a nine days' run of the mill yielded $2,300, besides one ton of sulphurets, which assay $00 per ton. Rocky Bar is working 30 men. The drift has been opened about 100 ft from the bottom of the perpendicular shaft, where the ledge is from 12 to 15 inches in width. The ledge is producing profitable milling ore, the last crushing of 00 loads, which was cleaned up yesterday, gave $38 per load. The main incline of New York Hill has reached a depth of 1,000 ft, carrying a small ledge, which is generally of a high grade of richness. This pay chute is not wide, but it produces enough to carry all the expenses of the mine, and give an occasional dividend.

TRINITY.

Cinnabar District.—*Journal*, June 7: The Altoona company last month produced 520 flasks of quicksilver, but owing to their having run short of pan-iron, the production this month will be small. The iron is now in Reading, and will be at the mine some time next week, when the retorts will again be run to their full capacity.

NEVADA.

WASHOE DISTRICT.

Union Con.—Gold Hill *News*, June 11: The point of interest in the Union now is the south drift on the 2300 level (2200 level of the Sierra Nevada), which has been turned to the west and is being carried toward the North Con. Virginia (now Union) shaft. A careful calculation makes the distance for this cross drift to run to reach the desired point 35 ft. It is also estimated that the distance to the east edge of the ore vein is from 40 to 45 ft, so that, if the ledge holds its course, and the formation is remarkably regular, no ore can be expected to be encountered in this cross drift. From it an upraise to meet the shaft is to be made. During the latter part of this week a chamber is to be excavated on the 2000 level, joint with Mexican, for a winze down to the 2300 level. The north and east drifts on the 2000 level are also to be cleaned out and the latter will be pushed on toward the Union shaft. The north drift on this level is now 415 ft from the south line, the face still in hard, blasting porphyry carrying some water.

Alta.—The east crosscut on the 1350 level is making good progress in favorable-looking quartz. It is just getting into the ledge proper and showing some spots of ore. The north drift, 1450 level, is still cutting half its width into the hanging wall, and still encountering porphyry on one side and quartz on the other. It is being run parallel with the ledge. The north drift on the 1550 level is within a very few ft of the Lady Washington line, and is partly in clay. The ledge seems turning across the face of the drift, and it is showing more quartz while still cutting a mixture of quartz, clay and porphyry. On the 1750 level the north and south drifts are being extended, and are in respectively 85 and 75 ft. The starting point of these drifts was carried east by the station on the 1750 level, and the drifts are now being turned west toward the ledge. When the clay is encountered they will follow it for bases for crosscuts.

Ophir.—The incline has reached a point 85 ft below the 2300 station, the bottom in a soft, kindly-looking vein formation. Chutes are now being excavated for the station, which work interferes with the sinking. The east drift, 2300 level, is in 95 ft, in a vein formation showing some quartz. South drift, 2100 level, is passing through low-grade ore, its face 150 ft from the bottom of the winze. The north drift from the same point is now in 100 ft in fine vein material. The usual repairs are going on. The ore stopes show no change. The clean-up for May was shipped last evening and amounted to $32,755.90; total for the month, $101,882.97.

Con. Virginia.—Usual progress is being made in the joint California west drift, 850 level, the face in hard, blasting porphyry, 272 ft from its starting point. On the 1500 level the south drift west of the stopes is 90 ft in a favorable-looking vein formation, carrying streaks of quartz. The main lateral drift to the Oould & Curry shaft has been enlarged and retimbered. The joint crosscut 1850 level, is in a favorable vein formation. The south, drift, 2150 level, is still passing through streaks of quartz and clay; total length, 147 ft.

California.—The joint workings with Con. Virginia on the 850 and 1850 levels are making usual progress, and are without particular changes of formation. Work in the bottom of the C & C shaft has been resumed. The flow of water is still heavy. The connection with the Ophir, 1750 level, is also receiving attention. The clean-up of bullion for the month of May will be shipped to-night. The total will not be far from $230,000.

Oould & Curry.—Saturday work in the face of the east joint crosscut, 1700 level, will be resumed.

Mexican.—The connection between the joint Union winze from the 1600 level and the upraise from the 2000 level to meet it, has greatly improved ventilation on both levels. Some time this week yet a chamber will be excavated on the Union line, from which to carry a large winze down to the 2300 level. A joint Ophir winze is to be soon started from the 2100 level to be carried down to the 2300 level.

Savage.—Retimbering the incline is completed. Putting in the drain to the Sutro tunnel connection. The pumps and pump column of the perpendicular shaft and the incline above the 1640 level will all be raised to the surface this week.

Justice.—On the 1500 level the main drift south and the west crosscut are both in a strong formation of mineralized vein material.

Sierra Nevada.—The incline is making slow progress below the 2400 level, and some 10 or 12 ft still remain to complete the sump. The flow of water continues at about 145,000 gallons per day. This, however, is readily handled. The breasts continue to look and yield well.

Julia Con.—Repairs to the south drift, 2000 level, have passed the hottest point and are making better progress. New pipes for compressed air are being placed in the shaft.

Con. Imperial.—The north drift, 2000 level, is now in 310 ft, and without change of material. The south drift, same level, toward Crown Point, is making good progress. The winze joint with Alpha is now 320 ft below the 2400 level, its bottom in quartz and porphyry.

Utah.—Repairs to shaft are about completed.

Bullion.—The winze engine is up and running, and sinking in the winze from the 2150 level is going on again. It is being sunk the whole size of the incline to give a chance for air and work. The engine has two reels and is counterbalanced. The winze will be pushed with vigor to the 2400 level of the Con. Imperial.

Yellow Jacket.—The shaft has now reached the 2000 level. Good progress is being made in connecting the shaft on the 2500 level with the old workings east from the bottom of the north winze. There now remain less than 200 ft to run.

Silver Hill.—Taking out a few tons of low-grade ore daily from the surface workings.

Belcher.—Oood progress is being made sinking the main incline, and it is now 53 ft below the 2700 level. On the 2560 level the south crosscut is in 80 feet, and advancing at a very good rate, with its face in promising quartz and porphyry.

Sierra Nevada-Mexican-Union Con. Shaft.—Sinking below the 1800 level is going steadily on as the shaft is being prepared for future efficient use. It will take some 10 days yet to get the bins and chutes all ready for the use of the skips.

Crown Point.—The station, 2700 level, has been completed and connection is now to be made with the Belcher on 2700 level—a corresponding level. The north drift, 2500 level, is in soft porphyry and being continued along the ledge.

Exchequer.—The north drift, 2400 level, is making the usual progress; total length, 427 ft.

Best & Belcher.—Work in the joint east crosscut, 1700 level, will be resumed Saturday. The Osbiston shaft is 10 ft below the 000 level. The flow of water is very heavy, keeping the pumps and bailing tank running.

Chollar-Norcross-Savage Shaft.—Waiting the completion of the Sutro tunnel sub-drain. Ready for work.

PARADISE DISTRICT.

Bullion.—*Silver State*, June 7: E. P. Torrey brought down from Paradise yesterday, bullion valued at $1,500. It was the product of ore from the Bullion mine, worked at the Sedan mill. "Eb" says he will bet on turning out $1,000 in bullion daily from Big Prize ore during the month of July, with his five-stamp mill, and he always bets to win.

The New Paradise Mines.—Charles Siskron informs us that the mines recently discovered on the west side of Paradise valley are creating considerable excitement. These mines are situated about 10 miles west of Spring City. One of the claims, called the Solid Silver, bids fair to be all that its name indicates. At a depth of 25 ft from the surface, the greatest depth attained on the ledge, the ore is surprisingly rich in native silver, and the lead is large and well defined. Other rich ledges have also been discovered near the Solid Silver, and the prospects for a rich mining camp are very encouraging. We saw some rich specimens of fine milling ore taken from the Scott, Ellivreet and other mines in Silver State district. The ore is the best we have seen from any outside district for some time. The owners of the mines say that they have a ledge of 10 feet in width of the same class of ore, and have great faith in their property as well as in the district, which is situated about 40 miles from Paradise district, on the same range of mountains. The gentlemen who showed us the ore think that when the mines

The Telluride Ores of Gold.

[Thesis by RUSSELL L. DUNN, College of Mines, University of California.]

It is only within the last decade that the telluride ores of gold have become of metallurgical importance. Before this period tbey were rare mineralogical curiosities only found in very small quantities, and in two or tbree widely separated localities. Transylvania was the principal source, though on the Siberian flank of the Altai mountains and in the States of Virginia, Nortb Carolina and Georgia some species were found. Their discovery first in California and later tbe more important one in Colorado, bas given them a new importance, and has directed the attention of tbe metallurgist to them.

So recently bave they become of economic importance, and so difficult are they of reduction, tbat tbeir beneficiation can scarcely be said to have passed the experimental stage. For these reasons, and because of their occurring in only a few localities where they can be worked as an ore, there is very little published about them. Again, all this is scattered throughout the whole range of mining literature, principally periodical, of the last six or eight years. In regard to tbe geological occurrence and mineralogy of these ores more complete investigation has been made, but the results are not perfectly satisfactory and are often contradictory.

In discussing these ores the first point to be considered is their

Geological Occurrence and Distribution.

In California the only localities where they are found thus far in workable quantities are in Tuolumne and Calaveras counties. In both in the great jura-trias slate belt on the motber lode or its feeders. *In Tuolumne county the predominating formations are argillaceous and silicious rather than talcose. Serpentine is one form of the metamorphism and is found in large masses. Besides the slates there are sandstones belonging to the same series in various stages of alteration, in some places so much so as to resemble true eruptive rocke, porphyritic and trappean. Highly altered limestonee are also found in this series. In Calaverae county the general geological characteristics of the slate belt are about the same as in Tuolumne, except that a talcose formation occurs more frequently. Also it carries a greater variety of valuable minerals and ores. The belt runs tbrough the west central portion of botb counties, and is bounded on the east side by granite which forms the principal mass of the Sierras.

The great motber lode of California with its feedere and parallel ledges crossed these two counties in the slate belt. On this lode and on parallel ledges at several points telluride ores have been found. Their range is, however, rather restricted; in Tuolumne county, in the Green, Raw Hide and Golden Rule mines, near the northern boundary, and in Calaveras in several miues about Carson Hill, near Robinson's ferry, in the southern part of the county. These localities mentioned aro not more than 20 miles apart. All of the mines were opened as free-gold miues, and as such have furnished, more particularly those about Carson Hill, some remarkably fine specimens of native gold *in situ*. It was not until they had been worked to some depth that telluride minerals were found.

The predominating rock of tbe region in Kern county where these ores are reported to have been found recently is granite, though small quantities of highly metamorpbic slates and sandstones are found in patches. Discoveries are reported by tbe local papers in San Luis Obispo county, but partieulars are not given.

In Colorado tbese ores are found in what is called the telluride belt. It is situated in the northern part of the State, and lies principally in Boulder county. It is about 20 miles long by from 3 to 4 wide, and extends from a point 20 miles soutbeast of Long's peak southwest into tbe northern part of Gilpin county. This region does not comprise all the localities in Colorado where telluride minerals are found, but is by far the most important, and the others may therefore be disposed of without detailed discussion. They all have some similar features, and align with eacb other almost across the entire width of the State. A peculiar blue granite characteristic of the Boulder county telluret region has been generally observed in all of tbese places.

The telluride region of Boulder county† is in the mountains on their eastern elope at an elevation of about 8,000 feet above tbe eea level. "The rocks of the mountains as a whole may be considered as composed of a great series of metamorphic rocks of pre-eilurian or archæan age. Quartzites, silicioue, micaceoue, eome bornblendic and garnetiferous schists, gneisees and granites all occur; the gneiss, with possibly granite predominating. The granite, though presenting the appearauce of eruptive granite, was probably formed *in situ*. The metamorpbism is extreme and was probably accompanied by a great eoftening of the rock, thus permitting of molecular rearrangement, so that it has now no trace of eedimeutary origin. The eame granite mass approached from opposite sides might convey entirely different impressions as to its origin; on one side metamorphic and indigenous; on the other, eruptive or exotic. The echists and granites are pieroed at many points by dikes of felsite porphyry, often differing in character in the different dikes. Besides theee dikes, the porphyry seems to have been forced out from the interior and forms rounded hills. The age of the porphyry is yet undetermined, but it is probably more recent than that of the triassic strata whicb flank the base of the mountains."

A careful study of the mineral veins* lying in tbis belt shows the existence of at least three sets of different ages:

1. Silver bearing; very prominent in tbe district immediately nortb of the town of Caribou.
2. Free gold bearing veiue or veins carrying no tellurides.
3. Veins carrying free gold and telluretted minerals.

The veins of tbese different sete cross each other at every conceivable angle, and in some places they are so numerous as to completely cut up the country rock. All of the veins carrying tellurides, seem, from their mineralogical constitution and other considerations, to be undoubtedly of the same age, and the peculiar situation of a few of them may throw some light on and possibly fix their geological age.

The cross-section of tbe Red Cloud and Cold Spring veins will illustrate this peculiarity of situation. The veine are contact veins, between a porphyry dike and gneissic granite; the dike forming the footwall of one vein, and the hanging wall of the other. †On the eide of the dike, the walls are clearly defined, but are indefinite and blend with tbe granitic materials on the eides adjacent to the country rock.

It eeeme probable from several indications that the intrusion of tbe porphyritio dike occurred subsequent to the filling of the vein and deposition of the telluride minerals and gold. The veins on each side of the dike eimilar in all essential points as regards mineralization, is unique and hardly possible on any other supposition tban tbat they were deposited at the same time. Did the dike come in first, it would be essential almost that they sbould be deposited at different periods. The vein matter is considerably altered immediately adjacent to the dike; the quartz is darkened and hardened, becoming cbalcedonic or hornstone. But a comparatively emall quantity of mineral is found in this portion of the vein, pyrite in small brilliant highly modified crystals being the principal one. The telluride minerals show a strong tendency to cling to the country-rock wall, and even find lodgment in tbe granite outside. No vein minerals except pyrite are found in tbe body of the dike. An examination of the ore with the microscope sbows the existence of minute shot of gold and even eilver (?), sometimee the former is found in nuggets of considerable sizes not yet wbolly reduced from its combination with tellurium. All of the above go to show the existence of a long-continued higb heat from tbe dike eide of the vein. This heat could not, however, have been sufficient to fuse gold, and was probably lower than the melting temperature of lead. The metallic gold could have been reduced to the form in which it is found in the veins, from its telluride combinations at the latter temperature.

A consideration of these facts shows that the two present veine were probably deposited as oue, at a period preceding tbe eruption of tbe porphyry. Other contact veins between porpbyry aud other rocks sbow eimilar features.

European Telluride Depoeits.

Iu Transylvania the tellurium deposits are accompanied hy igneous rocks of a more recent period than tbe eocene sandstones of that locality. In Offenbanya they occur under very peculiar circumstances. They are found in veins in igneous rocks, and in segregated masses in granular limestone. Van Cotta, in his treaties on Ore Deposits, page 277, abstract, says: "Tbe gold lodes appear dependent on trachytio or feldspathic, quartzose igeneous rocks (timazite, *i. e.*, propolyte), or to have been caused by their breaking out. The veins traverse, however, clay-slatee and eocene sandstones, in the neighborhood; from whicb circumstances, as well as from tbe tertiary age of tbe tracbytic rocks, it is very evident tbat they are more recent than tbe eocene."

No propolyte has been found in tbe Colorado telluride region [Marvin], nor so far as I am aware in the California localities.

Vein Formation, Etc.

In California the eame lode, or system of lodes, carries tellurides at one point, while not a trace of tbeir presence can be found at othere. They eeem here to come in chimueye or ore cbutes. Tbe wall rocks and ganguee are similar to those of other gold-bearing veine in tbe eame locality. The formation consiste of argillaceous, talcose and chloritic elates; the gangue of a pure white quartz. In Colorado we do not find such a coincidence in general features between tbe two correeponding classee of veine, nor do the telluride mineral veine of that State resemble those of California. The gangue is not a pure quartz, but is a harder and tougher rock, and fewer epecies and a less quantity of the common associated minerals are found than iu the other claes of gold-bearing veine of the same district. The thickness of the veins variee from a few iuches to six or eight feet, but the ricb tellurium ores occur in comparatively narrow eeams. Theee seams are not equally ricb throughout their whole extent, in some places completely pinching out, in othere forming extraordinary rich pockets and chimneys. Besides these rich seams the mineral is more or lese disseminated through the entire body of the vein, so that the only trace of its presence is a dark stain in the quartz.

Peculiaritiee in the condition of tbe mineral in different veins are often noticed, but have been little etudied. In some cases high crystallization predominates, in otbers is almost wholly absent. A peculiarity has been observed comparable to the "rusty" condition of gold. The general character of the ores, as we go down on the veins, does not materially differ from that mined above, except that tbere is a greater proportion of free gold near the surface and more pyrites frnrther down.

Concluelons.

A consideration of tbe preceding shows no peculiar geological relations, differing from those connected with tbe ordinary gold quartz formations, to guide in the searcb for uew telluride districts. As a matter of fact the chances are decidedly against findiug new districts by searching for them. In the first place the ores are rare. Again tbe veins in whicb they occur bave no distinctive outcrop or float, by which tbe prospector can identify them.

Tbe most extreme results of metamorphic action are observable wherever these minerals are found in sufficient quantity to constitute an ore. The deposits in Colorado would seem to be the oldest. They are found in the oldest known series of rocks, the archæan, and could hardly have been formed subsequent to the triassic. In California the formation is jurassic, or, as it is better considered, jura-trias, and the veins cretaceous [Clarence King].

It may be observed that tbe tellurium-bearing veins, though they are distinctive of the district in which they occur, do not predominate; invariably they are accompanied by otber metalliferoue veins or deposits in which no trace of tellurium can be found. Free-gold veins alwaye accompany them, also, as in Colorado and Siberia, silver-bearing ledges may.

It is probable that workable deposits of telluret minerals will yet be found in Colorado on tbe western elope of the Rocky mountains between the South Park and the New Mexico line, in tbe southeastern part of Utah among the epurs of the Wasatch mountains, and in California in tbe northeastern part of Kern county.

[To be Continued.]

*To avoid repetition of references, I will stats here that the facts for this geological discussion are principally taken from the "Mining Notes and Staff Correspondence" of the *Engineering and Mining Journal*, Vols. 23 and 24; "United States Geological Survey of Colorado," 1873, pp. 685, 690; Bowman in "Raymond's Report," 1875; and "Geological Survey of California."

†Silliman in "United States Gsological Survey of Colorado," 1873, p. 683; also Marvin, p. 685.

EASTERN INVESTORS.—Speaking of the interest taken in mining matters in the East, the New York *Stockholder* says: Until lately gold and silver mining has been left to the adventurers who thronged first to the Pacific States, and later to newer regions of Colorado, Utah, Wyoming, etc. The money of Eastern capitaliets formerly was adequately employed in railroad building, invested in bonds of railwaye, Government bonds and other securities, which, for the time, yielded satisfactory returns. Of late yeare, so many railroads have failed to pay interest on their bouds, tbat investment in them bas been discouraged. Government bonde no longer pay more than four per cent. per annum. This low rate of interest has led many of our eolid and judicious capitalists to give attention to mining enterprises as a source of large revenue. Within this year, particularly, great numbers of investors of tho richer eort have purchased iuterests in mines. We hear daily of our leading capitalists buying shares in new mines. Millions of dollars are going into that cbannel of investment, as is illustrated in the case of the Horn Silver mine, in Utah.

THE SOUTH AFRICAN CABLE.—The telegraphic cable to connect the European and Asiatic telegraphic eystems witb Cape of Good Hope will be 4,000 miles long, extending from the Red Sea cable, at Aden, around Cape Guardafui and along tbe east coast of Africa to Port Natal, where it will make a junction with the present land line to Cape Town. The cable will be laid along the coast, the depth being moderate along that side of the continent, and tbe facility for repairing possible breakages has been carefully ascertained. The cable will touch at Zanzibar, Mozambique, Sofala, Delagoa Bay, and thence to Durban as the submariue terminus, from wbich point tbe land telegraph becomes available to complete the circuit to Cape Town. The coet of constructing and laying the cable is estimated at $7,500,000. The line from Durban to Zanzihar ie to be finisbed in July, and the wbole cable by the middle of November.

AN AEROLITE.—The Eureka *Leader* says that Mr. James Marsh, of Huntington valley, brought from that eection a epecimen of a meteor which fell to the earth recently. He etated tbat the falling, wbicb took place early in the evening, was accompanied by a sound as loud as tbe report of a cannon. Parties on the ranch, in company witb Mr. Marsh, searched for, found and dug it out, the piece weighing in the neighborhood of 400 pounds. It is a hard, dark-colored substance, and wben scraped with a knife reveals a bright lead-colored interior, but much harder than lead. The eurface is indented witb concrete rings, evidently graven by its rapid whirling motion.

LOOKING UP.—The prospeots of Bristol, a mining town in eastern Nevada, appear to be brightening—a faro game has recently been opened there.

Leadville as It Is.

The acme of business prosperity in Leadville was reached about six weeks ago. Then merchants had all they could do, restaurants were crowded, hotels overflowed, every chair in the saloons pre-empted, tbeaters attended by drowsy eleepers, because beds were not to be had for coin, lumber fresb from the log $55 per thousand, freight from Webster (the end of the Denver and South Park railroad track) five cents per pound, tbe stages arrived full of passengers every night and the army of weary pilgrims a-foot came like a cloud of locusts from the East; real estate way up—naked lots on the prinoipal business streets selling for $10,000 each. All this was six weeks ago. There has come a change. Merchants are skirmishing for business and many declare they are not paying expenees; restaurants are going behind. One of the principal restaurant proprietors told me bis receipts had falleu from $400 to $75 per day; his rent is $300 per month and he must inevitably close his business. The hotels now have ample room for all their guests; tbe saloons are not overrun with custom; the theaters are not patronized as they were; lumber has dropped from $55 to $17 per tbousand, and freight from the end of the track has fallen to two cents per pound. The coming crowd hae lessened, while the departuree bave increased. Fifty-five dollars per tbousand for lumber induced the erection of 40 saw-mills; bigh prices for goods brought in bundrede of merchants; while five cents per pound for freigbt mentioned in Kansas and Missouri was of itself sufficient to send every available quadruped in tbose States to the front to haul for Leadville. So everything has been overdone. Real estate now has no fixed price, and lucky is the poor fellow who can get 30% of what he considered his property was worth two months ago. The whole trouble is, that 20,000 people have gone in to do a business that cannot legitimately afford a eupport for over 4,000 souls at the outside. The sanitary condition of Leadville is not what its admirers could wish, nor do the local press give tbe truth in this respect. Pneumonia is the most prevalent and fatal disease, and the death rate ie from five to eight daily—or, say, 42 per week, just one-half that of San Francisco, with its population of 300,000 souls. The cemetery of Leadville, in use but little over a year, speaks in tones more melancholy than words.—*Cor. Salt Lake Tribune.*

The San Pedro.

The valley of the little river which is named the San Pedro, presents the possibilities for a very iufluential positiou in the future of Arizona. Territory. It is expected, of course, that the mining interests of this country will be foremost. The peoplo of capital, and tbeir myriad employees, will pay attention to that alone; and whoever allows himself to stop and plod away on a ranch, may in time come to be looked upon as a curious specimen of man among those who only think of "lodes," and "walle" aud "pay streaks," etc. But there will be a few who will still think it wortb while to depend upon Mother Earth. Properly managed, the San Pedro valley will furnish homes to many a thrifty family. The Soutbern Pacific railroad will cross it from east to west, and it is obvious that there must be a thriving town close by, wbence will be taken supplies for Tombstone and other mining districts which may rise into successful life in the near future. The Whetstones, the Dragoons, where some good prospects are reported, the eastern spurs of the Catarinas, and all the regions to the southward would be tributary to a town located in or near the San Pedro. The valley is broad and rich; its length is fully a hundred and fifty miles; and the stream has a peculiarity unusual in tbat locality—it never runs dry. From tbe mesa bench on each side, to the valley proper below, there is a sharp descent, tbe banke baving, on a small scale, the canyoned appearance of tbe Colorado and otber remarkable streams. There are numerous points where the valley is actually walled, and where tbe floode of the rainy season migbt easily be stored for use in the event of scarcity, in which respect it has greatly the advantage of the Santa Cruz, Salt River and Gila. Probably the San Pedro would have been far in advance of wbere it is to-day, but for two things: Tucson has always had the advantage of being nearer, and of more easy accese to Sonora; and the San Pedro has been the very etronghold of that etrange and violent eystem of belief known in modern parlance, as Apacheism.—*Arizona Citizen.*

A CURIOUS CAVE.—Some time eince N. Bell, of Pinos Altoe, while out hunting near tbe Mogollon mountaine, came upon a large cave which, upon examination, was found to contain carved etone images, and various other articles of human workmanship. The cave is of natural formation, being about 100 feet in length by 20 feet wide and 7 feet high. Tbe walls are elaborately ornamented with grotesque figuree, wrought in colors the brilliancy of whicb is still well preserved. Mr. Bell had no time to make a thorough examination, but eatisbied himself with bringing away such of the imagee, etc., as he could conveniently carry, purposing to return at an early day and complete hie examination. One of the images, measured about two feet in length and weigbed nearly 40 pounds.

More Mills Wanted.

One had rather see too few mills in a district than too many, as nothing looks worse in a camp than idle quartz mills. But it is obvious that Bodie is now in downright need of greater milling facilities. It will probably be a somewhat suprising statement to strangers that with their record as a bullion-producing camp, they have never had more than 54 stamps in the district—20 at the Standard, 20 at the Syndicate, 10 at the Bodie, and 4 at the Miners. Heretofore the three last named have been run as custom mills, the Bodie mill at present running on Bulwer ore, and the Syndicate working for various companies. The Miners mill has an engagement for an indefinite period on Noonday ore.

Recent developments, however, and the gradual growth of the district, have created a great change in the milling requirements. The new discovery in the Bodie mine creates an imperious demand for the use of a mill by that company. If they take their own mill the Bulwer people will be compelled to move out. The Syndicate company are but awaiting the connection on the Osceola vein, between the upper and lower tunnels, to commence crushing their own ore, of which there is a sufficient quantity to keep the mill running for years to come. While the ore is not high grade, there is considerable more money in it for the company than to run on custom rock.

Then comes along the Tioga. This mine could now keep a 20-stamp mill running for a long time upon ore from its 320 level; and if the vein is found to hold its own at the 520 level, at which depth a crosscut is now being run to intersect it, the Tioga really will need a mill of its own. The Bechtel, Blackhawk, Summit, Belvidere, Con. Pacific and South Bulwer all have considerable good milling ore on hand, and while they may not need mills of their own, they would certainly be good customers. The Noonday will probably continue crushing at the Minere until they put up a mill of larger capacity on their own account.

As it stands now some one is bound to be crowded out, and that before many weeks. If the Bulwer continues crushing at the Bodie mill, and the Bodie people have the Syndicate—and they must have that mill or their own—there will be no facilities for the other mines mentioned to crush ore. The fact is that the Bulwer and Noonday, and probably the Tioga, need mills of their own, and a good 20-stamp custom mill outside of these would find constant employment. In short, the milling capacity should at least be doubled within the next 90 days.—*Bodie Standard.*

Working Beds of Mountain Streams.—Mr. J. C. Kernan, in *American Exchange:* I have for a long time been studying the best method to work the beds of mountain streams. The old system of damming the rivers is very little practiced now, experience having taught the miner that the time to work was so short and the labor and expense so great, that it would not warrant them in continuing the method then practiced. That there are millions of wealth in the beds of mountain streams in the vicinity of the rich mining districts of California, all who have had any mining experience will concede. How to get at that wealth and to open up a new field of industry where the many willing hands might find remunerative employment, has been my incentive to continue that study until I had accomplished my object. I now feel confident that I have succeeded in my undertaking. I propose to work the bed of the stream from the surface or above the water; to build a raft of the required dimensions, and then place it in any position desired. Raise the debris to the surface by means of implements constructed for that purpose, empty it into a receiver, where the gold is separated, and the residue emptied into the water again. No labor will be required except to turn the crank which raises the material from the bottom.

Signal, Mohave County.—Deserted village. Each Arab has folded his tent and gone. Of the busy town of 1,000 people, plenty of McCrackin script and more expectations, perhaps 25 are left, until hardly a sound is heard. All due to the splendid management, or no management, of the Signal and McCrackin mines. So much for the management of men who sit in palace offices, luxuriantly furnished with other people's money, who think they know how to manage a valuable mining property, but have always failed. Everybody here, those who know, and those who ought to know, believe that both these mines are as good to-day as they were years ago, and the ore just as rich at least. The appearance of the mines and the assays of the ores prove both these assertions to be correct.—*Cor. Enterprise.*

Honors to a California Tree.—We learn by the proceedings of the Highland Agricultural Society, of Scotland, that our native tree, the silver fir *(Picea nobilis)*, is in high feather for planting in Scotland, where it was first introduced from northern California in 1831. A specimen in Argyleshire, blown down in 1874, was nearly 60 feet high, and girthed 6 feet 6 inches at the butt, and 3 feet 8 inches 20 feet from the ground. Aside from its great beauty for shade and ornament, it is recommended to be planted as a common forest tree.

Useful Information.

Grindstones.

What can disable a machine-shop more effectually than to destroy the *grindstone!* Unless the loss were supplied by the modern substitute, the emery grinder, to destroy the grindstone would be to wreck the shop. A thorough study of the subject will develop more requirements than many think, and much ingenuity or skill in designing might be displayed in working out the problem. It should be strong, simple and clean; the trough expanded to catch as much as possible of the drip water and grit; a movable shield securely hinged to keep the water from splashing, and yet permit the stone to be used from either side; rests provided upon which to rest tools and the rod for turning the stone, these rests being arranged to move toward the center as the stone wears smaller. The bearings should be generous in size, proper provisions being made for oiling without washing the grit into the bearings with the oil, and the ends of the bearings being protected by some device which effectually prevents the entrance of the grit. The stone should be secured to the shaft by nuts and washers, and the washers fixed so that they can not turn with the nuts as they are screwed up or unscrewed. In hanging the stone, great care should be taken to hang it true sidewise, not only for convenience in using, but because a stone that is not true sidewise can never be kept true edgewise.

Suppose a stone to run one-fourth of an inch out of true sidewise, and while in motion draw a line around it within three-eighths of an inch from the edge, on an average. From this line there would be but one-fourth of an inch of stone on one side and one-half on the other. If you had a stone only this in thickness—that is, a stone one-fourth of an inch thick on one side and one-half of an inch thick on the other—would not the one-fourth-inch side wear away faster than the other? That is exactly what it does on that side of the thick stone, only the thicker the stone and the less it is out of truth the less it wears.

Coloring Metal.

A foreign paper gives the following: Metals may be rapidly colored by covering their surface with a thin layer of sulphuric acid. According to the thickness of the layer and the duration of its action there may be obtained tints of gold, copper, chestnut brown, clear aniline blue, and reddish white. These tints are all brilliant, and if care be taken to scour the metallic objects before treating them with the acid, the coloring will suffer nothing from the polishing. On making a solution of 640 grains of lead acetate in 3,450 grains of water and warming the mixture to 88° to 90°, it decomposes and gives a precipitate of lead in black flakes. If a metallic object be immersed in the bath, the precipitate is deposited upon it, and the color produced will depend on the thickness of the deposit. Care must be taken to warm the objects to be treated gradually, so that the coloration may be uniform. Iron treated in this way has the aspect of bluish steel; zinc, on the contrary, becomes brown. On using an equal quantity of sulphuric acid instead of lead acetate, and warming a little more than in the first case, common bronze may be colored a magnificent red or green, which is very durable. Very beautiful imitations of marble may be obtained by covering the bronze objects warmed up to 100°, with a solution of lead thickened with gum tragacanth, and afterwards submitting them to the action of the precipitate spoken of above.

Lubricants.—The evils attending the use of oils and fats as lubricants upon machinery are well known to engineers and mechanics, but the causes and nature of their injurious action are not so generally understood. We give, therefore, a brief but very lucid explanation of their action which we find credited to Dr. Marquardt, by our contemporary, the Boston *Journal of Chemistry.* The most obvious and least objectionable evil attending their use is the gradual oxidation (or gumming) which they undergo, and in consequence of which their lubricating qualities rapidly diminish. A more objectionable property of these substances shows itself when they are applied to such parts of machinery as are more or less highly heated. In such circumstances, these substances are decomposed into their constituents, glycerine and fatty acids. The latter combine with the iron work of machinery to form an iron soap, the metal surfaces being corroded thereby and fresh surfaces exposed to corrosion. Marquardt recommends the substitution of the mineral oils (heavy petroleum products that boil above 600° F.) for animal oils and fats as the remedy.

The Importance of Sanitary Engineering. Prof. Trowbridge, of the School of Mines, in a recent lecture before the Engineering Society, advised young engineers to give their attention to sanitary engineering, and reminded them that a problem worthy of the closest observation was the excessive cost of railroad transportation. The problem that now pressed upon them, said he, was of a social nature—how to prevent disease, and how to elevate the poorer classes. No doubt there would be a future in which the engineer, the capitalist and the statesman would unite for the promotion of human welfare.

Painting Walls—Seasonable Hints.

Of course, says the *American Builder*, everybody knows, or ought to know, that walls and ceilings are finished with plaster. But everybody may not be aware that plaster has the property of absorbing moisture. This, perhaps, will not take place in rooms where a fire is kept steadily; but in rooms left, as is often the case, for weeks without a fire, the walls will take up a considerable quantity of damp. The effect will be injurious to the health of the inmates. There are few persons who have not suffered from a mysterious cold, caught they know not how, though, perhaps, damp in the plaster had something to do with it.

The extent to which damp is absorbed in a plastered wall may be discovered by noticing what so often takes place in rooms where the walls are painted and have become chilled by a season of cold weather. As soon as the temperature becomes warmer the atmosphere is condensed on the walls, and at times in such quantities as to run off in streams. Now, had it not been for the paint, the greater portion of this moisture would have been absorbed by the plastered walls. And as a consequence the quality of the plaster would have been impaired and the room made unwholesome. In view of this effect in plastered walls, it becomes a question well worth considering, whether, in finishing a house, the walls should be papered or painted. If paint is decided on, it is highly necessary that the painting be properly done and good materials employed.

To Restore the Luster of Jewelry.—Take one ounce cyanido potassium and dissolve in three gills of water. Attach the articles to be cleansed to a wire hook, immerse and shake in in the solution for a second or two, and remove and wash in clean water, then in warm water and soap. Rinse again, dip in spirits of wine, and dry in boxwood sawdust. If the solution is kept, put it in a tightly corked bottle, and label *poison* conspicuously. One caution is necessary: Do not bend over the solution so as to inhale the odor, nor dip the fingers in it; if one of the articles drops from the hook, better empty the solution in another vessel.

Pigments from Coal.—Powdered coal is treated with nitric acid, or with nitrate of soda or potassa, and sulphuric acid. Then a portion of the coal will dissolve in caustic or carbonate of alkali, yielding a dark brown solution. A black residue remains behind, which may be used as a paint. The brown alkaline solution may be used at once, or a brown precipitate may be obtained by adding an acid.

Good Health.

The Cause of Consumption.

Dr. Rollin R. Gregg, of Buffalo, New York, is confident that he has solved the mystery of consumption. Regular physicians will be apt to say that he has mistaken a condition for a cause; nevertheless we are inclined to think that good may come from the emphasis he lays upon that condition, since it seems calculated to work a beneficial change in the customary treatment of the disease.

Dr. Gregg argues that as the loss of albumen from the blood through the mucous membrane of the kidneys in Bright's disease, rapidly and fairly depletes the system, much more must the more rapid loss of albumen through the mucous membranes of the lungs be serious in all its stages and speedily fatal in its results, if proper measures are not taken to stop such waste before fatal conditions have arisen. The expectorations of consumptives, and all their other catarrhal or mucous discharges from whatever organ, are mostly albumen and a direct loss of so much of this constituent from the blood. It is this wastage which causes the great emaciation characteristic of consumption, and not, he thinks, any failure of the system to assimilate food. And this loss of albumen does miscbief not only in robbing the muscles of their proper nutrition, but also in throwing the constituents of the blood into disproportion. The loss of one ounce of albumen destroys nearly a pound of blood for all purposes of healthy nutrition, and leaves in the blood a relative excess of 5¼ ounces of water, 7 ounces of blood corpuscles, 9 grains of fatty matter, 15 grains of fibrin, and 41 grains of salts. These elements in excess act the same as foreign matters in the blood, and disturb the entire economy of the system. Night sweats and dropsy are the result of the excess of water. The blood corpuscles left in excess are decolorized by the too watery blood, and are deposited in the capillaries or smallest blood vessels, where they shrivel and become tuberculous corpuscles, so called; the fatty matters in excess cause the fatty livers and other fatty degenerations attending the disease; the excess of fibrin causes the adhesion of the pleura to the inner surface of the ribs, the heart, or to each other, often among the most serious of the complications of consumption; and, finally, the excess of salts causes calculi, enlargement of the joints, ossifications, and similar morbid developments.

In such cases of consumption as are characterized in their earlier stages by an absence of profuse expectoration, Dr. Gregg would attribute the beginning of the disease to a loss of albumen through some other organ or organs, the shriveled blood corpuscles lodging in the lungs, starting tubercules there and setting up a dry cough, with the resultant irritation of the mucous membrane and outpouring of mucous. From this point of view, there is but one source of hope to the consumptive in any stage of the disease, and that is through the healing of the mucous membranes and the stopping of the waste of albumen. By this means, in the earlier stages of the disease—with all who have not inherited the most feeble constitutions—there is much to hope from judicious treatment.

Whatever may be the primary cause of consumption, it is pretty evident that the mucous discharge which attends the disease and finds relief in expectoration is to be repressed rather than encouraged; and to do this must radically change the usual treatment of the disease, at least in its early stages.—*Scientific American.*

Petroleum in Pulmonary Diseases.—The following is extracted from the *Bulletin de Therapeutique:* "Dr. Blache states that a refiner of petroleum having been prohibited by a *prefet*, at the request of some *pharmaciens*, from the distribution of petroleum in medicinal doses, this led to an inquiry being made as to its alleged utility in affections of the chest. The native petroleum from Pennsylvania and Virginia was that experimented upon first. It is a very safe substance, for even large quantities, when drunk by error, have caused only a little nausea. In chronic bronchitis, with abundant expectoration, it rapidly diminishes the amount of the secretion and the paroxysms of coughing, and in simple bronchitis, rapid amelioration has been obtained. Its employment in phthisis has been continued for too short a time as yet to allow of any opinion being delivered as to its efficiency, beyond that it diminishes the expectoration, which also loses its purulent character. The petroleum is popularly taken in doses of a teaspoonful before each meal, and after the first day any nausea which it may excite in some persons disappears. M. Gardy, a Paris *pharmacien*, has prepared capsules, each containing 25 centigrammes of petroleum, or, as he calls it *huile de Gabion*, from the name of an ancient petroleum spring, and this Dr. Blache considers as the most favorable mode of administering it."

Repairing the Eye.—Some curious facts have come to light about the regeneration of the eye during experiments made by M. Philipeaux; facts of a very pleasing kind if we only infer that what applies to inferior animals is applicable also to man. M. Philipeaux has been, it seems, anxious to discover whether ou completely emptying the eyes of young rabbits and guinea pigs, the viteous humor would be reorganized, and whether even the crystalline would be reproduced. With this view, he has been conducting his operations, always, of course, taking care not to touch the crystalline capsule, for experience has shown that in order that an organ shall regenerate, a portion of it must be left in its place. It seems that a month after the mutilation was effected, the experimentalist was able to state that the eyes, which had been emptied, were filled afresh, and that the crystalline was reconstituted. He operated on 24 animals, and in each case the multilated eye revived. This would seem to show that the optic organ has the same capabilities as the bones. The organic process repairs an evil and reconstructs, more or less completely, that portion which has been struck off from the whole.

Death from Toothache.—A Miss Stevens of Walton, Delaware county, died on May 1st of toothache. Although this is a rare occurrence, this is an undisputed case of death resulting from an excruciating toothache. The victim, who was a young American woman employed in a family in Walton, had suffered some days with a terrible toothache, which accompanied an ulcerated jaw. An attempt was made to extract the troublesome members, but her teeth were broken off and her face was too sore to permit their removal by the painful process of cutting away the gums. The girl suffered entire nervous prostration from the extreme pain, and gradually sank under it until death ended her sufferings. An army surgeon, who attended her, pronounced her symptoms the same as those following the amputation of a limb.—*Middletown. N. Y., Press.*

Wearing Garters.—If garters are worn, it is important to know how to apply them with the least risk of harm. At the bend of the knee the superficial veins of the leg unite and go deeply into the under part of the thigh, beneath the ham-string tendons. Thus a ligature below the knee obstructs all the superficial veins; but if the contrivance is above, the ham-string tendons keep the pressure off the veins which return the legs. Unfortunately, most people, in ignorance of the above facts, apply the garter below the knee.

The Board of Health of Carlsruhe, Baden, publishes a notice stating that chemical analysis shows that the outer portions of the packages of American canned beef which have been in contact with the tin of the case, are impregnated with lead, and are injurious to health. Consumers are advised to cut off a thin paring on all sides of the package before using the meat.

Oatmeal Relish.—Fill a saucer nearly full of well-cooked oatmeal. Now fill the oatmeal full of strawberries (pressing them in), ripe peaches, ripe pears, or some such fruit. Add a little sugar and cream. It is a rich and delicate dish.

Business Announcements.

Litton Springs Park Association, of Sonoma Co., Cal.

The Week.

The gradual and steady influx of Eastern capital into our mining stock market, has apparently so frightened the manipulators of "black Friday" peculiarities, that a mouthpiece in the person of Alex. Delmar has taken the trouble to relieve his mind in a disreputable letter to the New York *Sun*, in which he warns Eastern people against our bonanza and quartz mines generally, asserting that the Comstock lode is used up, and that California's current product of $15,000,000 in gold is derived chiefly from hydraulic mines, and that these latter are choking up our rivers, filling up our single harbor, and utterly ruining our agricultural lands. No excitement has been created by this monstrosity, the facts are patent that quartz mining on this coast is entering a period of unexampled prosperity.

From all authentic sources, new and paying gold mines are being opened in greater number in this State now than at any other time. In the Bodie district there is more wealth in sight than ever before, and all the indications for the future of most other districts are most favorable.

The most discouraging point about Leadville is that the gold supply is not permanent, slight deposits, although Senator Jones in an interview asserts that "the yield of 1879 will be so large as to create a new era in mining, and show our capitalists that these mines are one of the great sources of the wealth of our country, and that this year promises to be as memorable in its mining excitement as the year of the bonanza discoveries." It is a fact, however, that Leadville is over-crowded. From all of the mining districts come reports so favorable, that to particularize would be regarded as an affectation.

The Groans of the Alaskans.

A few months since the country was startled by a cry for help from the white settlers of Sitka, the capitol of Alaska, to prevent their threatened massacre by the Indians of that Territory. This appeal for aid was so fervent and urgent, that a British man-of-war was dispatched by the English authorities at Victoria to prevent if possible this impending disaster. Since that time the leading journals throughout the United States have commented strongly and even bitterly on the attitude into which our government has been brought toward that Territory through the weakness and inefficiency of our navy, animadverting with no little asperity on that niggardness of Congress that has forced us to have recourse to the aid of a foreign power to protect American citizens on American soil. The isolation of Alaska, its inaccessibility, the supposed rigor of its climate, and the savage ferocity of its native tribes have all tended to retard its exploration and colonization, the condition of affairs having meantime been greatly mystified through the conflicting accounts that from time to time have appeared in regard to them. A few of the more salient points connected with the geography, wants and resources of this region may be epitomized as follow: Alaska, as far as commercial relations and native population are concerned, may be divided into two distinct regions. The first of these, according to W. H. Dall, of the Smithsonian Institute, lies to the north and west of Mt. St. Elias and is inhabited by Indians and Esquimaux, who are entirely friendly and in no way dangerous to the whites. One portion of them—the Aleuts—are semi-civilized and have of course the fault of occasional drunkenness. The second region lies to the east and southeast and is peopled by a race entirely different ethnologically from the Esquimaux and Indians. These in their own language are called "Khinkets," while to the settlers on the coast they are generically known as "Sitka Indians." Unlike their northern neighbors they are a cruel, reckless, impudent and murderous set of savages, little disposed to respect anything less than the overawing influence of the government. They are ruled wholly by their passions, and when drunk or otherwise excited hesitate at nothing that interferes with the gratification of their desires. The country they inhabit is densely wooded with spruce, pine, fir and other conifers, useful and available for timber. The climate is about that of southern New York, the summers being wetter and cooler and the winters mild. That this region is fertile and productive has been practically shown by the successful culture here of potatoes and vegetables of various kinds, as well also as of the grasses and we believe the cereal grains.

The mineral wealth of the country, with the exception of coal, remains largely to be determined. Gold, silver, iron, manganese and other ores are known to exist, but how far they will hereafter pay for the working is a matter of speculation.

It is the southern portion, the seat of the late troubles, towards which attention is now more particularly directed. The chief governing influence over all this region is that exercised by the Alaska Commercial Company, which has a monopoly of the fur trade and as far as possible applies the law and keeps the Indiane in subjection. But apart from this there is no settled government, and from the company's inability to protect the lives and property of the white settlers and traders, has arisen the question whether the white inhabitants of Alaska, citizens of the United States, are entitled to such protection and government as shall suffice to shield their lives and property from the rapacity and cupidity of the savages? Clearly they are, the only point of difficulty being how, in view of their remote position, their limited numbers and the scanty resources of the country, this protection can be best extended to them. An organized government is hardly called for. Regular troops stationed there could protect only a few points and accomplish but little good, the same being nearly true of cruisers along the coast, while neither soldiers nor armed vessels would effect anything towards opening up and exploring the interior. This can be best effected by inducing a mining population to enter the country and commence the search after gold and silver. To promote this the government might find it expedient to aid and encourage a movement of this kind in the first instance. Facilities might be afforded adventurers for reaching the Territory in public vessels, something being contributed also toward their outfit, with a little assistance towards getting them up the rivers, and the promise of helping them out of the country should they wish to return.

Such, it strikes us, is the true way to settle this Alaska problem. If the precious metals abound in that region these pioneer prospectors will soon find them, and our public officials will need trouble themselves no more about the exploration and settlement of the country, the protection of its inhabitants, the organization of a Territory, nor any of these other matters that now so worry and perplex them. The care of this whole business will be taken off their hands by the first emigration that reaches the country, and the latter from a dead weight will be speedily converted into a self-sustaining agent. With a considerable mining population thrown into Alaska the Indians there would cause but little more trouble, the better class of them heeding themselves to peaceful pursuits and living in harmony with the whites, while the more savage would meet with early extinction. If there is not enough of the precious metals in these our more northern possessions to draw in and retain there a good many miners, they can never or at least for a long time become much populated, and may as well be given over, certainly for the present, to the Aleska Fur Company and such others as may desire to carry on fishing, trapping and kindred callings in the woods and waters of that distant and gloomy region.

California Mines in More Request at the East.

From an old resident of this State, and who for a number of years has had much to do with placing mines on the Eastern market, we learn that there is more inquiry in that quarter for California gold mines at the present time than ever before. Having tried investments in stocks, and experimented some with the mines of Colorado, Nevada, Utah, Arizona and other of the outside States and Territories, these Eastern parties are disposed now to buy mining properties in this State, and carry on the business here in a practical way. They have well considered, what we have so often said and so constantly insisted upon, how much more safe and satisfactory the business of mining has proved to be in California than in these other countries. All that is required now to encourage this inclination on the part of the people abroad to invest here, and so insure for our mining industries a greater prosperity, is a willingness on the part of mine owners to dispose of their claims or interests therein at reasonable figures, coupled with a disposition to act justly and fairly all round.

There is no denying that in the matter of selling mines very extravagant ideas have prevailed in regard to the value of these properties, and that purchasers have as a general thing paid too much for them. In most cases the sellers have fared better than the buyers, for the reason that the former have been apt to entertain exaggerated notions about the value of their mines, while the latter have not figured with so much closeness in these as is their wont in other business transactions. Because they have to do with the production of gold and silver a vague idea obtains that this class of enterprises ought to yield profits irrespective of careful calculations and close economy. This is a false and dangerous assumption, and should no longer be acted upon. Buyers should be as circumspect and exacting in purchasing this as any other kind of property.

As regards the value of this species of property, none are apt to entertain such wild notions as the veteran miner. He is the most hopeful, confident and sanguine person that lives. The calling implies the possession of these qualities on the part of those who pursue it. The doubting and distrustful take none of the hazards involved in this business, preferring smaller gains with greater certainty. But your genuine miner sees everything in glowing colors and loves to take desperate hazards if only there be one chance in a hundred to strike a big thing. He is prone to over-estimate, one great success so impressing his imagination that he forgets a thousand failures. He is often misled, not by others, but by his own wild fancies, and so becomes the means of misleading others who repose confidence in his judgment and experience. It is the case too that these mine vendors have sometimes been guilty of very sharp practices. So frequently has this happened that the phrase "honest miner" is with many deemed to have only an ironical signification. Sometimes too the veteran miner will, with the best intentions, sadly miscalculate, and occasionally his intentions are none of the best. And thus it comes to pass that both he and others suffer loss through his errors of judgment or his errors of intention. It is to be hoped that this growing interest in the mines of California will be met in a spirit of such fairness and liberality as will tend to give it further encouragement, and that parties who have mining properties for sale will not insist upon the purchaser paying for the same a little more than they are worth, and taking all the hazard besides.

While speaking in our last issue of mines lately disposed of to Eastern parties, we were in error in saying the large hydraulic property mentioned was sold by Mr. Leet. That gentleman has, as stated, large sums deposited to his credit for the purchase of California mines on Eastern account, but was not the vendor of the hydraulic property alluded to, our informant having got two transactions mixed.

The Eclipse of 1880.—Mr. A. F. Goddard, of Sacramento, is preparing an excursion party of 50 or more to observe the line of the total eclipse of the sun, which will occur next January, visible in California. His object is to locate the excursionists along the route of the total shadow, selecting the grandest points of view, establishing the line by appropriate monuments from the coast to the Sierras. We have no doubt such an excursion in advance of the eclipse would be productive of much pleasure as well as a means of verifying astronomical calculations.

Dry Amalgamation.

The plan of dispensing with the use of water in effecting the amalgamation of quicksilver with the precious metals, appears to be growing in favor with our millmen and practical metallurgists. Ever since the attention of the mining public began to be strongly called to the advanteges of this method through the partial introduction of the Paul process, for crushing and amalgamating the ores of gold and silver wholly dry, it has been gradually working its way into a larger use. That this should have been the case is not surprising. When we consider the percentage of loss that attends humid amalgamation, it seems strange that the dry plan has made so little progress, its superiority having been so clearly proven through the many successful trials of the Paul invention.

From Mark Silver, a young man who has had a good deel of experience in milling ores, we learn that one of the Paul crushers, supplemented by a novel method of amalgamation, has been employed for the past six months with gratifying results in the mill of Chas. D. Smyth, at Murphy's Camp, Calaveras county. The ore here, after being pulverized and brightened in the manner peculiar to the Paul machine, is dusted on a copper-plated, mercury-coated cylinder which revolves in a dust proof chamber. The instant the gold so brightened touches the quicksilver it is taken up even to the finest atom, while the base metals and all other refuse matter are rejected and thrown into the stream below, none of these latter during their brief contact being able to attach themselves to the surface of the revolving cylinder. For the purpose of cleaning up, a lathe rigged with a hard piece of rubber is brought to bear against the cylinder while in motion, relieving it effectually and so readily of the amalgam that a delay of five minutes suffices for cleaning up the mill. With the aid of these appliances gold-bearing quartz has been worked in large quantities with much greater closeness than it is possible to do with arastras; and so manifest are the advantages of the mechanisms here employed that a great revival in quartz mining is likely to ensue in the district mentioned. The miners in the neighborhood are bringing in their ores freely to Mr. Smyth's mill to have them reduced by the new method, preferring to pay from six to seven dollars per ton to have them so treated rather than crush them free of charge in their own arastras, or pay even so much as two or three dollars per ton for having them worked in the old-style quartz mills. The ores here being usually of good grade they can well afford to pay this difference, as Mr. Smyth returns them fully 30% more gold than they can get having their ores treated by any other process. From some lots of ore reduced at this mill highly satisfactory returns were obtained, though they were so base that they could not be worked with any profit where amalgamation with water was practiced.

This experiment has created a demand for a 20-stamp custom mill at this nearly defunct camp, and so much new life has this improved prospect infused into the miners that there will probably be as much as 40 or 50 additional stamps required there within the next six months. The cost of outfitting and running this is not greater than of the old-style mills—indeed, we suppose it is somewhat less.

Almarin B. Paul, the originator of the process that bears his name, has well explained in his pamphlet descriptive of the same, the advantages of amalgamation by the dry method as well as the greater cheapness of the machinery employed in its practice, which latter he argues commends strongly his plan where economy in preliminary expenditure becomes a controlling consideration. That mercury when performing this office of gathering up and holding the precious metals should be used without the intervention of water would be inferred irrespective of results reached in practice. The disposition that exists between these several metals to unite being due to affinity or attraction, that the interposition of a bad conductor like water should tend to weaken that power stands to reason. Overman, a high authority in chemical and metallurgical science, remarks on this point as follows: "All metals appear to have a tendency to float in water, when in fine particles, some more than others. This is caused by a particle of gas—either air or water gas—adhering to the particles of metals, which *causes them to float. Precious metals appear to possess more of this quality than others.*"

Taking up the hint contained in the above extract, Mr. Paul enlarges upon it in substance as follows: Water adheres tenaciously to whatever it touches. Through its use in amalgamating we put in the first place a jacket of water about every atom of mercury and gold and silver, whereby their metallic surfaces are kept from actual contact, and then proceed to agitate and grind them with a view to destroying this covering and compelling them to unite. Now water is repulsive to the precious metals, and no union can take place between them except forced by gravity or friction. But this friction produced between iron surfaces tends to eliminate the repulsive elements that reside in all ores, and being so brought out coat with a gaseous film the precious metals they contain, and so place a barrier between them and the mercury. In dry amalgamation the mercury comes in direct contact with the particles of metal, and of course performs its duty with greater efficiency.

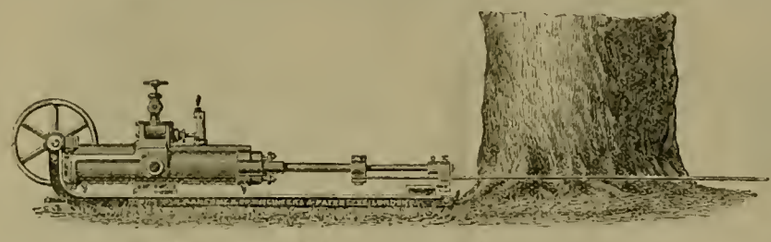
Ransome's Patent Combined Steam Tree-Feller and Log Cross-cut Saw.

We present to our readers in this issue various representations and a detailed description of the above novel and useful machine, for which Mr. Walter Laidlaw, of Oakland, Cal., has been appointed general agent for the United States.

The want of a really efficient machine which would effect a substantial economy over the tedious process of felling and cross-cutting trees by the axe or hand-saw, has caused a great many attempts to be made to achieve this result by the employment of steam power; but the machines hitherto invented for this purpose have failed, in consequence of being so complicated and troublesome to fix, that the time expended in moving them from tree to tree, and preparing them for work, has more than counterbalanced any saving which they effected when actually cutting. The simple little tool represented in three views, is not open to this objection, as it can be firmly fixed to any tree which it is required to fell or cross-cut in less than two minutes, the agent tells us: and as the medium size (which will fell trees up to four feet in diameter) is less than four cwt., it can be readily carried about by four men. It works with incredible rapidity, sawing down a hard wood tree three feet in diameter in less than five minutes, we are informed, and attended by a gang of four men. One machine will, with ease, fell eight such trees in an hour, including the time occupied in moving and fixing it. As it will work in any position, it will fell trees growing on slopes, and by simply shifting the working parts into another frame, it becomes an excellent cross-cut saw for cutting logs to length as they lie upon the ground. All the working parts are very simple, and by the aid of the printed instructions accompanying each machine, any man of ordinary intelligence can work it.

The chief advantages claimed for this machine, are: 1. That it effects a great economy of labor, as one machine attended by a gang of four men will do more work than 30 axmen. 2. That it effects a great economy of timber, for as it saws the tree off close to the ground, it saves all that portion of the tree which would be cut into chips, if felled with the ax. 3. That the ground cleared by the tree-feller can be left absolutely level, for by simply removing a sod four and one-half inches thick, the saw works on a ground line, and, consequently, the stumps do not obstruct the passage of carts, etc. 4. That used as a cross-cut saw, it will cut logs to exact lengths, and as its cut is perfectly square, it consequently obviates the expense of trimming the ends of lumber in the mill.

The machine consists of a steam cylinder of small diameter having a long stroke, attached to a light wrought-iron frame, upon which it is arranged to pivot on its center, the pivoting motion being worked by a hand-wheel turning a worm, which gears into a quadrant cast on the back of the cylinder. The saw is fixed direct to the end of the piston-rod, which is made to travel in a true line by guides, and the teeth of the saw are of such a form as to cut only during the inward stroke. By this simple device, saws as long as nine or ten feet can be worked without straining apparatus or guide, as its own cut is sufficient to guide the saw in a straight line through the tree, and as the teeth offer no resistance to the outward stroke, all possibility of the saw buckling is avoided.



RANSOME'S PATENT STEAM TREE-FELLER—SIDE ELEVATION.

The machine is supplied with steam at a high pressure from a small portable boiler, through a strong flexible steam-pipe; and as this may be of considerable length, the boiler may remain in one place until the machine has cut down all the trees within a radius which is determined by the length of the pipe. When fixed for felling, the machine is merely laid on the ground and set fast by a strong screw to a trident pointed bar, which is driven firmly into the tree with a few blows of a sledge-hammer. When fixed for cross-cutting, it is held by a hinged dog-hook, driven into the log close to the saw.

The perspective sketch shows the manner in which the steam tree-feller is applied in the woods for felling and cross-cutting. Steam is supplied from a special boiler, made as light as possible, consistent with sufficient strength to resist a working pressure of 100 pounds to the inch. The boiler is mounted on a four-wheeled carriage, upon which provision is made for carrying the tree-feller with its hose and tools. The boilers are made with large fire-boxes for burning waste-wood, etc.; and each is fitted with a safety-valve, blast-pipe, steam pressure gauge, water gauge, donkey pump, whistle, water-tank and set of stoking tools. A boiler for working a single tree-feller of the medium size should be of four nominal horse-power; but when one boiler works two machines, as shown in the engraving, it need not be more than six horse-power, as it would rarely happen that both the tree-feller and cross-cut would be requiring their full supply of steam at the same moment.

For logging, getting out railroad ties, shingle and cedar bolts, posts, cord wood and ship-knees, a machine of this kind will be found most invaluable. Any boiler of a portable engine, capable of maintaining a working pressure of 50 pounds on the square inch, may be made available for supplying it with steam. In places where a large portable engine can travel, the boiler of the same may be used for driving two, three or four tree-fellers at once, and thus one stoker can be made to serve several machines. Four men suffice to work any size of tree-feller, namely, one to operate the machine; one to drive the wedges into the cut, to prevent the tree from pinching the saw, and to control the direction in which it falls; one to stoke the boiler, and a fourth to assist generally. When the machine is required to be moved from tree to tree, all four men are available for that purpose.

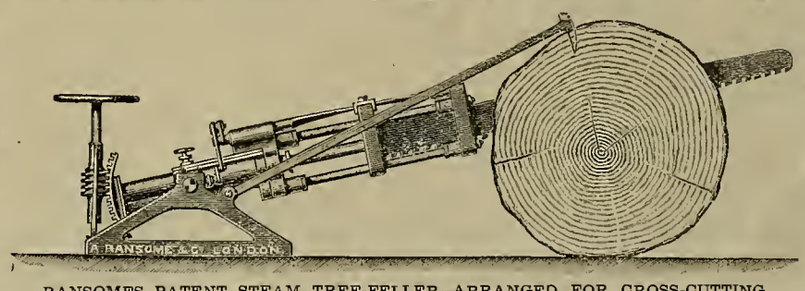
The foregoing description refers more particularly to the medium sized tree-feller, which will cut down any ordinary timber, but the larger size, which fells trees up to six feet in diameter, is necessarily somewhat heavier. It may be carried suspended from the axle of a small two-wheeled carriage resembling a light "timber jim." When so slung, two men can move it about with the greatest ease.

This patent steam tree-feller having been thoroughly tested on a great variety of trees, ranging from one to seven feet in diameter, the result of its working given above may be guaranteed. The jurors of the forestry class at the Paris exhibition last year, after seeing it at work, marked their appreciation of it by awarding it a special silver medal.

Although they have been but a few months in the market, the steam tree-feller has already found its way into many distant parts of the world, including the East and West Indies, New Zealand, Australia and Japan; and the rapidly increasing demand for them is the best proof of their practical success. They are made of three sizes, as under, and may be had either as tree-fellers or cross-cut saws, or as combined machines with interchangeable frames for both purposes.

Size.	Diameter of largest tree.	Weight of machine.	Power of Boiler Required.
No. 1.....	2 feet	3 cwt.	2-horse power.
No. 2.....	4 feet	3½ cwt.	4-horse power.
No. 3.....	6 feet	5½ cwt.	6-horse power.

PERSPECTIVE VIEW SHOWING TREE-FELLER AND CROSS-CUT SAW AT WORK.



RANSOMES PATENT STEAM TREE-FELLER—ARRANGED FOR CROSS-CUTTING.

Mines and Minerals of Algiers.—It appears from the last report of the French Minister of Public Works that France and Algiers are rich in mineral resources which are only partially productive, owing to the indisposition of capitalists to invest in the mining industry. Algiers particularly contains immense mineral deposits, which have been but imperfectly inspected. In spite of this Algiers exported during the past year iron, copper and lead to the value of over 6,000,000 of francs, and the exportations of these metals during the past decade are valued at over 44,500,000 francs. This production is but a small portion of what might be exported were the mines to be developed by capital. The mines of Kef-Ourn-Theboul, Cape Cavallo, in the province of Constantine, and of Gar-Rouhau, in Oran, contain rich veins of argentiferous galena. Antimony, mercury and zincare found in paying quantities in El-Hammemat, Ras-el-mas, south of Philippeville, and in Constantine and Oran. The minister complains of lack of capital and economical transportation, and hopes that government will supply the deficiencies.

Immigration to the United States is now at the rate of nearly 4,000 persons per week, and steamship companies are about to "hull" steerage rates.

There are $60,000 worth of marketable beef in Grant county, Oregon, awaiting buyers.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are bereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, tbe

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device haviug already occasioned several deaths and other erious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO., 18 & 20 Fremont St., San Francisco.

Dewey & Co {202 Sansome St.} **Patent Ag'ts**

Continued from page 381.

are opened up a trifle more there will be a big excitement about the camp.

ITEMS.—The Paradise company have 20 men at work sinking winze from 2d to 3d level. This winze will open the ledge 109 ft between the levels; 1,600 tons of ore now await the completion of the mill. The Big Prize is producing considerable rich ore; 125 tons which will work about $200 to the ton have been extracted in the past three weeks. The Bullion has suspended work for the present. Building an ore road. Plenty of ore in sight. The Gulch ledge is producing some very rich ore. A vertical shaft, 60 ft deep has been sunk, cutting the ledge at that depth. A rich strike has been made in the Rattler, 45 ft from the surface. Ore streak one foot thick, averaging $267 per ton. The Sedan mill is running steadily, and working ores up to 80% of their assay value.

ARIZONA.

STONEWALL.—*Silver Belt*, June 4: The Stonewall mill, although running but five hours out of the 24, in consequence of the scarcity of water, is turning out bullion at the rate of $200 per hour. We think it will not be long before a full supply of water will be obtained, and as the ore is abundant, the mill will then run on full time.

COPPER MINE.—Probably the largest and richest copper mine in the world, exists in Yavapai county. It is said to be a solid wall 18 ft wide and a mile long, and of great depth.

COLORADO.

LEADVILLE.—Denver *Tribune*, June 4: Nearly every ft of land is being prospected, and miners' cabins may be found on every hand. On Carbonate hill, since the Pendry strike, there has been prospecting going on in every possible direction, and some of the holes are very promising One can stand near the foot of the hill, just above the city, and count no less than 30 prospect holes and mines on the west side of the hill alone, many of which have been started since the Pendry strike was announced, a month ago. This last mentioned mine offers to be one of the best in the camp. The ore is high grade, easily mined, and is found in large quantities. It closely resembles the ore found in the New Discovery and in the Pittsburg group generally. The discovery of this deposit so far below any other pay streak yet found upon this hill, has put nearly all the mining experts at fault. With but few exceptions they have all held that there was but one deposit or stratum, if you please, of these peculiar ores, and when once past the "contact," it was useless to examine farther. The Pendry lies within 500 ft of the Crescent, running at right angles, or nearly so to that claim, and about 30 ft in a vertical line lower down the hill. The deepest workings of the Crescent are scarcely more than 75 to 100 ft below the surface of the ground, while the Pendry deposit lies 200 ft below. That there are more deposits than that one I have no doubt. That this deposit in the Pendry is not the same upon which the Crescent, Carbonate, Ætna and others are working, I am equally as well convinced. It is scarcely possible that such a break could occur in the Crescent deposit as is suggested by some of the mining experts. The dip of the Pendry deposit does not warrant such an hypothesis as this, but, on the contrary, seems plainly to indicate that the Pendry is another and a distinct deposit from the upper one, upon which the other mines are now at work. If it shall eventually turn out (as I firmly believe it will) that there are several of these deposits—one overlying the other—then the future of this camp is beyond question. The character of the mineral may change, after two or three layers have been passed, and true fissure veins appear at a great distance below the surface. I make no doubt that before summer fairly sets in there will be 20 mines on Carbonate hill that will take out paying mineral in good quantities. The cost of smelting has been very much reduced during the past two weeks, so that ore which was of comparatively little value then has been brought into pay now. Still, there are but very few mines that will take out any more mineral than is necessary for development, preferring to wait a more auspicious time, when the returns will be much greater.

LITTLE PITTSBURG.—The Little Pittsburg silver mining company, of Leadville, Colorado, have declared a dividend of $50 per share, aggregating the nice sum of $100,000, payable on June 7th. This company have extended this courtesy five times before to stockholders, making, with the pending dividend, $600,000. Colorado is receiving more attention than usual as a mining section. Her bullion product for 1878 was $9,820,700, the largest in her history. But that amount will probably be exceeded this year. Since 1859, it is estimated that Colorado has produced over $81,000,000 in bullion.

IMPORTANT DISCOVERY AT HILLERTON.—A short time ago a rich vein was found about two miles from Hillerton, on the Gunnison, by R. H. Hammil and others. The vein is a two and one-half ft crevice of virgin or crystallized quartz, identical with that found in California and Australia. The ore is said to assay $3,400 not 10 ft from the surface.

IDAHO.

YANKEE FORK.—*World*, June 3: John Hepburn, who came in from Bonanza City, a few days ago, inform us that there are now 400 or 500 men in that place, and hundreds more are coming. He predicts that 5,000 people will go to that and the adjoining camps during the next two or three months. The wagon road from Challis to Bonanza City will be completed in two or three months, when two mills will be shipped to the latter place. Men going to Yankee Fork in search of employment will be disappointed. There are as many miners there now as can find work. A specimen of ore from the Norton mine, in Yankee Fork district, was worked at Idaho City, which weighed just 7½ ounces, and yielded about $10 in gold. This would make the ore worth about $10,000 per ton.

SNAKE RIVER.—*Statesman*, June 5: The accounts from Salmon falls are flattering; everyone getting rich on the Miles bar. Glenn & Co. comes next with a water ditch nearly completed on ground where there was $4 per day made with a rocker. Corker, Parsons & Co. are getting an engine to hoist water on their ground below Lewis' Ferry, and expect to be running soon. Clark & Co. are running on Cold Spring bar, and are making money very fast. Lang, Snyder & Donohue are putting up a machine on the ground adjoining Clark & Co, and will be running in two or three days. Blackwell, Delano & Glenn have ordered plating, and are busy bringing a ditch on their ground from Clark's ditch. There are parties surveying a ditch to bring water out of Snake river, on Black & Co.'s ground, four miles below Cold Spring.

MONTANA.

THE GAGNON.—*Mirror*, June 3: The Gagnon mine, near Butte, yields rich ore of two kinds, viz., rich free-milling ore from the croppings to the depth of 60 ft; then high-grade, argentiferous, copper, smelting ore, from a vein which is quite narrow in its upper portions, where it approaches the free-milling ore but widens to an average of four ft in the lower or 150 level. This mine became a heavy dividend-paying mine almost the week after it was opened. Ore has been taken out of the lower level which samples 30 ounces of silver to the ton. Although opened 100 ft below water level, the mine contains but little water.

NEW MEXICO.

ITEMS.—*Grant County Herald*, May 31: Both mills and two new furnaces are at work. The week's yield of silver is something over 4,000 ounces. The receipts of gold from Pinos Altos, during the present week, exceed the receipts of any previous week during the past 12 months. Extensive reduction works, we are informed, will be erected at Los Cerrillos. The owners of the Mina del Tiro have contracted to furnish 30 tons per day to the proposed works from that mine, and as they have hundreds of tons of fine ore in stope, no chances of a lack of ore to keep the new works in operation need be feared. In the meantime, the miners can be developing their claims with the assurance that they will have a home market for their ores. The Mina del Tiro has a large amount of ore in sight that will run 140 ounces to the ton, in addition to an inexhaustible quantity of lower grade. Two newly-opened mines near Santa Fe, New Mexico, have been named, respectively, the U. S. Grant and the Globe-Democrat. They are perfect boomers in the quantity of precious metal which they yield.

UTAH.

MINING NOTES.—Salt Lake *Tribune*, June 6: The Germania smelting and refining works will be under full headway in a few days. A scarcity of ore has prevented them from running all of their stacks. The Union Pacific Express Company received from the Christy mill yesterday, one bar of bullion, $2,169.97; two bars from the Pioneer mill, $2,662.95; and six bars from Park City, $4,488.-15; total, $9,321.67. Yesterday, Wells, Fargo & Co. received two bars of Horn Silver bullion, $4,000; and five bars of silver from Silver Reef, $4,613.41; total, $8,613.14. Since our last report, Warnock & Co. have received 158,-467 pounds of Horn Silver bullion. Pig lead is in demand in the Salt Lake market. Mr. Scott informs us that he has had calls for the past two weeks for the article, and now has orders for two tons, but as there is none in the market, he is unable at present to supply the demand.

News in Brief.

GRASSHOPPERS continue their ravages in Sierra valley. Many farmers have suffered severely.

HAILSTONES weighing from five to twelve ounces fell thick and fast at Wichita, Kansas, on the 9th inst.

THE better part of Silver Reef, Washington county, Utah, was destroyed by fire on the 31st ult. Loss over $250,000.

ENGLAND has but one sugar refinery, producing 20 tons of loaf sugar per annum, while the San Francisco refinery produces 35 tons.

A FAMINE is predicted in Russia by Russian journals. Cause—war, drunkenness, holidays, cattle plague, beetles, marmots and mortgages.

IT will require 300 years to flood the Colorado desert, according to Fremont's plan, so says a Los Angeles mathematician. We can't wait.

THERE was in the State treasury June 1st money to the amount of $1,624,418.66. Gold, $1,369,300; silver, $225,679.87; legal tenders, $9,438.79.

THE Oil City *Derrick* states, in a resume of the month of May last, that 390 wells were completed in the oil regions with a production of 9,002 barrels, a slight decline.

THE rise in the price of silver has slightly stimulated the demand on the United States Treasury for standard silver dollars. The West is now ordering more of this coinage than ever before.

MR. EADS says that no dredge boat has been used at the South pass jetties during the past ten months, all reports to the contrary notwithstanding. The channel is now able to take care of itself.

FREIGHT from San Francisco to Hong Kong, by steamer, $6 per ton; distance, 7,000 miles. Freight from Oakdale to Sonora, Tuolumne county, by prairie schooner, $15 per ton; distance 35 miles.

ST. LOUIS is to have a new museum of fine arts. Ground was broken last week. The material to be used is stone from the Bedford quarries of Indiana. It will be ready for dedication in 12 months. Cost $80,000, a donation by Mr. Wayman Crow. Now, Chicago!

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Northern Belle, from June 2d to June 7th, inclusive, $8,794.20; California, June 7th, $99,-022.58; Hillside, June 8th, $5,400; Ophir, June 7th, $22,134.13; Argenta, June 9th, $10,500; Independence, June 9th, $10,600; Indian Queen, June 2d, 4,520.05.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

BLACK ROCK M. CO.—Object: To mine in El Dorado county, Cal. Capital, $400,000. Directors—John Tipp, N. T. Root, H. J. McLoire, C. H. Leavitt, C. F. Travero.

BODIE CON. M. CO.—Object: To operate in Mono county, Cal. Capital, $10,000,000. Directors—C. A. Burgese, John F. Boyd, George B. McAueny, George W. Sessione, Lewis Teese, Jr., Thomas Bell, William H. Lent.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING JUNE 3D, 1879.

216,140.—HYDRAULIC PROPELLER—B. B. Brewer and B. B. Ward, Sacramento, Cal.

216,089.—HORSE-POWER—L. Herbert and W. V. Henry, Hicksville, Cal.

216,098—DOOR-KNOB ATTACHMENT—D. & T. Morris, S. F.

8,740.—LUBRICATOR—N. Seibert, S. F. (re-issue).

216,244.—SCREW-PROPELLER—John B. Ward, S. F.

216,061.—DREDGING-SCOOP NOZZLE—S. W. Shaw, S. F.

216,150.—CORSET—Geo. H. Clark, Portland, Ogn.

216,148.—ORE-ROASTING FURNACE—D. W. Brunton, Silver Peak, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SELF-ADJUSTING BRACELET. — Wm. A. L. Miller, S. F. Dated May 27th. This is a novel construction for ladies' bracelets, and consists in a means of adjusting a single band bracelet without exposing the adjusting devices, and without any additional catches or attachments. This is effected by constructing the single band bracelet with a hollow slotted cap at one end, which is fitted to receive the opposite perforated or notched end of the band, and is provided with a means for securing the notched or perforated end at any point, so as to adjust the bracelet to any desired size.

DOOR KNOB.—D. & T. Morris, 1045 Market St., S. F. Dated June 3d. This invention relates to an improved means of securing and adjusting door knobs on the spindle which passes through the door and unites the knobs on opposite sides, and the improvements consist in the employment of a sleeve which is fitted to the spindle so as to slide easily upon it, this sleeve being connected with the knob and so constructed that it may be compressed or clamped upon the spindle so as to hold the knob at any desired point, and fit the shank upon each side of the door so that no washers will be needed to adjust the knobs to different thicknesses of doors. No screws or rivets extending into the spindles will be needed to attach the knobs.

ROLLER AND PULVERIZER.—Geo. Meding, S. F. Dated May 27th. This invention relates to that class of pulverizers or clod crushers which are rolled over the ground, and by that means break up the lumps and leave the soil in proper condition for sowing seed. The improvements consist in making the rollers of a series of four-sided bars placed so that the edges of said bars strike the ground and act more effectually on the lumps than a flat surface does. These bars may be removed at will or turned so that fresh edges are presented when the others are worn. The bars may be turned four times. The small lumps may pass through the interstices, and by being rolled over and over on the sharp edges inside the roller, are pulverized, and the dirt will then fall through on to the ground.

The Wilbraham Rotary Piston Pump.

This new pump, recently perfected by Wilbraham Bros., of Philadelphia, is a rotary piston pump, which, for simplicity of construction, efficiency of work and economy of operation, is said to be a very decided improvement upon any pump for ships' use hitherto perfected. The editor of the N. Y. *Nautical Gazette*, who has seen two sizes in operation, says, "that although working under disadvantages, yet their efficiency was demonstrated beyond question, and demands more than a passing notice of commendation. The moving parts are not subject to universal wear any more than an ordinary shaft, under average conditions. There is another pump at work which is of 6½ gallons capacity per revolution, which runs as required, at speeds varying from 50 to 175 revolutions per minute, and delivers more than its estimated capacity with perfect ease and noted economical use of steam."

The *Gazette* says further: "One of the features of this pump is that as to the openings in the pumps, and also the flanges, being of the same diameter the difference of suction and delivery is made by the pipes attached to the pumps. So that it is immaterial which is made the suction or delivery, as this pump works equally well either way; hence its value as a ship pump, especially in water ballast ships. These pumps are arranged to be driven either by belts, gearing, or engine attached to them direct."

"The Reading railroad steam collier, *Achilles*, is fitted with one of these pumps of 6½ gallons capacity per revolution. The pump of the *Achilles* is rated by the makers as a 6½-gallon pump, and it is connected with the water bottom through a 10-inch valve, and has an 8-inch outboard delivery pipe. The water bottom is 154 feet long, 36 feet wide at its top, and 3½ to the keel, and when full its water capacity is rated at 350 tons, although it is never completely filled. The pump is driven by a 9x9 vertical engine, and in port, the donkey boiler, carrying 40 pounds of steam, is used to discharge the water ballast; and with 25 inches depth of water under the engine room, this lowers the water 10 inches in 8 minutes, and has done even better than this. When the steamer is under way, the pump is used to circulate the water through the condenser, the steam being from 25 to 28 pounds pressure, furnished from the main boiler. These facts, we have obtained from Mr. John L. Howard, superintendent of the Reading R. R. Co. colliers, and can, of course, be relied on as authentic data.

"Mr. Howard, General Superintendent of the Reading Railroad Company's coal piers and collieries at Port Richmond, pronounces the Wilbraham rotary piston pump by far superior to any appliance of its kind he has ever tried, and he has tried almost every kind of pump in the fleet of 13 steamers, which he handles with remarkable skill and wonderful economy. Any appliance which is adapted for the use of these vessels must be of the highest standard of merit, as to capacity of action and economy of working. Hence we look upon his endorsement as satisfactory proof of its value." One of these pumps has lately been brought to this coast, and can be seen by those interested at the office of J. C. Senderling, 51 Fremont street.

PERSONAL.—Our well-known botanical contributor, Prof. J. G. Lemmon, has, we learn, turned his face toward the south en route for San Bernardino, in search for new plant treasures. Prof. Lemmon is one of our most enthusiastic and tireless investigators, and it is fair to presume that the world will know more of San Bernardino after his visit.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoograpbicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 415 Market St., second floor, S. F.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, near Drytowa, Amador County, California.

Notice is hereby given that at a meeting of the Board of Trustees, held on Wednesday, the twenty first day of May, 1879, an assessment (No. 38) of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary at the office of the Company, Room 8, No. 402 Front street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the first day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eleventh day of August, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees. W. O. WILSON, Secretary.

Office, Room 8, No. 402 Front street, San Francisco, Cal.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, Cal

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1) levied on the 17th day of April, 1879, the several amounts set opposite the names of the respective shareholders, as follows:

507 Mechanical Movements.

Every mechanic Should have a copy of Brown's 507 Mechanical Movements, illustrated and described. Inventors, model makers and amateur mechanics and students, will find the work valuable far beyond its cost. Sold by DEWEY & Co., Patent Agents and publishers of MINING AND SCIENTIFIC PRESS, San Francisco. Price, $1, (post paid.

To Pacific Coast Inventors.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE.

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards

R. HUGHES, Proprietor.

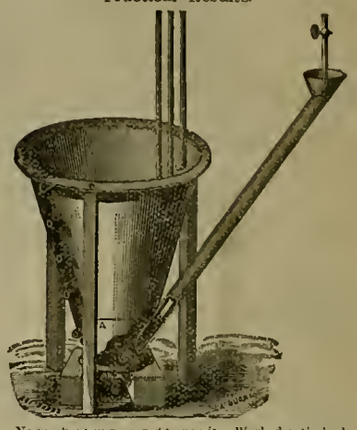
At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

STEVENOT'S

Fine Gold Amalgamator.

Adapted for Ores, Tailings, Slimes, Etc.

Unequaled for Cheapness, Lightness and Practical Results.



No mechanism required to run it. Worked entirely by pressure of water throwing the ore forcibly on to and through a body of mercury.

E. K. STEVENOT,

Chemist and Mining Engineer,

304 Montgomery St., San Francisco.

REPORTS MADE ON MINES. Quartz Mills, and Works of every description started.

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the License of this Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradise Valley, Jefferson, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Piomosos.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News.*

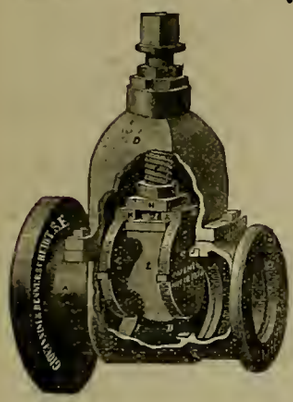
Union Brass Foundry and Mechanical Work Shop.

GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.



The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

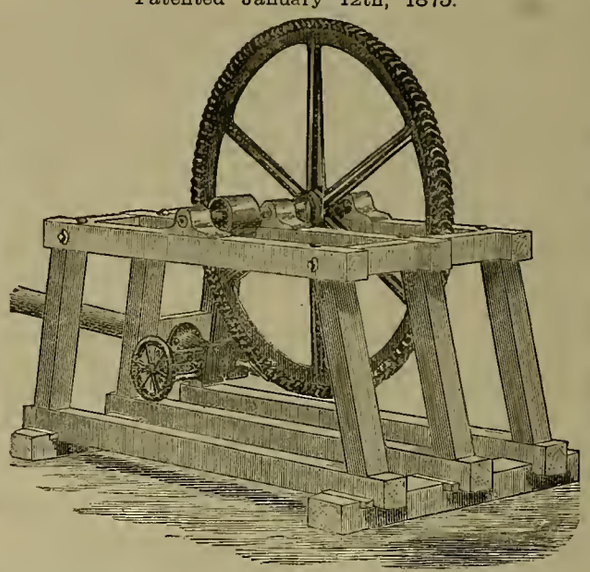
Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1–Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Rob't Robinson, Supt.
1–Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1–Eight-foot wheel, running Lincoln Gold Mining Co.'e Mill, Amador County, Cal.; 40 stamps.
1–Eight-foot wheel running pump at same company's mine. S. D. R. Stewart, Supt.
1–Eight-foot wheel, running Keystone Con. Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2–Four and one-half foot wheels, used in hoisting by reversible water power at same company's mine. O. C. Hewitt, Supt.
1–Four and one-half foot wheel, running Original Co.'s Mill, Amador County, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1–Four-foot wheel, running Gover Mining Co.'s new mill, Amador county, Cal.; 20 stamps.
1–Eight-foot wheel, running same company's old mill; 10 stamps. John Palmer, Supt.
1–Six-foot wheel, running Talisman Mining Co.'e Mill, Amador county, Cal.; 10 stamps.
1–Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1–Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; 10 stamps. John Palmer, Supt.
1–Six-foot wheel, running St. Patrick's Mill, Newcastle, Placer county, Cal.; 15 stamps. Jno. Townsend, Supt.
1–Eight foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s mine, State of Nevada.
1–Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; 10 stamps; Oregon.
1–Four and one-half foot wheel, running Republic Mill, Nevada county, Cal.; 20 stamps. E. H. Dyer, Supt.
1–Six-foot water wheel running at the Plumas Eureka Mill, Cal., 48 stamps, 2 pans, 7 ore-breakers and 22 concentrators.
1–Eight-foot water wheel running 40 stamps for the same Company. Wm. Johns, Sup't.
4–Six-foot water wheels running the Sierra Buttes Mills, Sierra Co., Cal. Wm. Johns, Sup't.
2–Six-foot and 2 four and one-half-foot wheels running Soulsby G. M. Co.'s Mills, hoisting and pumping works, Sonora, Tuolumne County, Cal. J. Leechman, Sup't.
1–Six-foot water wheel running Providence 20-stamp mill, Nevada City, Cal.
1–Four and one-half-foot wheel running DeFrees Mill, Tuscarora District, Nevada.
1–Six-foot water wheel running 20 stamps at Julian mine, Newcastle, Placer Co., Cal. A. H. Schnabel, Prop'r.
1–Six-foot water wheel running Mammoth Mill, 30 stamps and 14 pans and ore-breakers, Mammoth Lake District, Mono Co., Cal. Clark, Sup't.

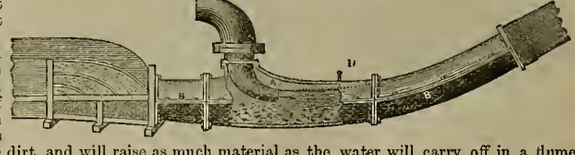
HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.



Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

LITTON SPRINGS PARK ASSOCIATION, OF SONOMA COUNTY, CALIFORNIA.

ANNOUNCEMENT EXTRAORDINARY!

A BEAUTIFUL HOMESTEAD IN THE COUNTRY THAT WILL PAY FOR ITSELF IN THREE YEARS!

2,600 Acres of Choice, Finely Wooded Land, to be Sub-divided into Farms of 20 and 100 Acres each, making

SIXTY FARMS, AVERAGING FORTY ACRES EACH.

Large Hotel, nine Cottages and other improvements, together with valuable Seltzer, Soda, Iron and Sulphur Springs, and 200 acres of land to be set aside and sold three years hence for the benefit of the shareholders. The improvements on this property have cost over $70,000.

Capital Stock, $150,000, divided into 60 shares of $2,500 each, payable $500 cash, and $500 in one, two, three and four years, in MONTHLY INSTALLMENTS. Half shares issued when two persons will combine to take one share.

The Subscription Book of the Stock of this Association will be open and ready for signatures on Monday, June 9th, 1879, at the office of the Association, No. 12 Montgomery St., S. F., near the Hibernia Bank. M. THEO. KEARNEY, Manager.

☞ Those wishing to visit the property can obtain tickets at half rates by applying to the Manager. HOTEL AND COTTAGES FOR RENT. The right man can rent the above property on very easy terms if applied for immediately.

IMPORTANT ANNOUNCEMENT.—On and after June 2d, 1879, passengers for Sonoma County can take the elegant and swift-going San Rafael steamers, and connect with the cars of the S. F. and North Pacific R. R. at San Quentin, thus greatly reducing the time, and bringing Litton Springs Park within less than three hours' ride of this city. Arrangements have also been made for reduced fare to such an extent that round trip tickets to Litton's can be purchased at our office for $3. Passengers can leave this city at about 7:10 A. M., spend four hours at the Springs, and return the same day. No more delightful trip can be found anywhere else in this State.

PLAN OF THE ENTERPRISE.—THE LITTON SPRINGS PARK ASSOCIATION has purchased for the sum of $150,000 the well-known Litton Springs property, which contains 2,600 acres of beautiful land, and includes most valuable seltzer, soda and iron springs, together with a fine hotel, nine cottages, large barn, school house, bottling house and other improvements—the improvements alone having cost over $70,000. These improvements having been made within four years, are almost as good as new, and in excellent condition.

TERMS.—The capital stock of this Association is fixed at $150,000, divided into 60 shares of $2,500 each, payable as follows: $500 at time of subscription, and $500 in one, two, three and four years, in monthly installments, with interest at the rate of 8% per annum on deferred payments. Those subscribers who desire to make advance payments of any portion of the amount due will be allowed a discount at the rate of 4% per annum, which, added to the interest of 8% they would be charged with on the deferred payments, would make 12% interest per annum they would get for their money.

The Association does not deem it advisable to divide this property into more than 60 shares, but if any would-be subscribers desire to take only half a share, and they will bring some friend who will subscribe for the other half share, then one-half shares will be issued to each.

In addition to the great natural beauty for which this property is so famous, it is designed to have the division lines of the various farms indicated by osage orange and other hedges, as is done to such great advantage in England and on the Continent. In addition to that, about FIFTEEN MILES OF AVENUES will be laid out through the property. These Avenues will be named Walnut, Almond, Olive, Cherry, Fig, Persimmon, Mulberry, Peach, Plum, Orange, Palm, etc., and it is the intention of the Association to plant trees on both sides of these Avenues of kinds corresponding with the names of the Avenues. Such an arangement will, in a few years, provide a series of drives so unique and charming that their equal cannot be found anywhere else in the United States, and will make the farms in this property so desirable as summer residences for the wealthy residents of San Francisco that the value of the farms may reasonably be expected to double several times. A VILLAGE SITE will be laid out near the hotel and springs, with lots 75 feet front by 150 feet deep, which will provide plenty of room for a cottage and garden around it, and a place in the rear for a stable at a considerable distance from the cottage. Lots will be reserved and donated for church, school, lecture-room and other public buildings. Special efforts will be made to induce college, seminary and other religious, educational and charitable associations to locate upon this property. Building lots have been set apart for co-operative fruit canning and drying establishments and for a co-operative winery. It is confidently expected that the beauty of the situation, healthfulness of the climate and accessibility from San Francisco and other portions of the State, and the proximity to the hotel and valuable mineral springs, will make this village the SARATOGA OF THE PACIFIC COAST.

The Association has secured 60 lots in this village, one of which will be donated, free of cost, to each subscriber to the stock of the Association. It is proposed to set apart the hotel, cottages, mineral springs, and about 200 acres of land as a separate parcel. The hotel and cottages are then to be rented to some good hotel man for the next three years, who will carry it on as a first-class health and summer resort, and secure for it the popularity to which its beauty and advantages entitle it. At the expiration of three years it is intended to place the hotel reservation of 200 acres, including the mineral springs and buildings, upon the market for sale for the benefit of the Association. It is confidently believed that the present great depression in real estate will have passed away by that time, and property be selling at much higher rates. In any event, the development of this enterprise will greatly enhance the value of this property, and the reservation should certainly sell for $150,000—considering the great value of the mineral springs, the value of the 200 acres of land, and the fact that the improvements have cost over $70,000. If the property does bring that price, then the shareholders will receive back $2,500 on each share, which is the full price of the shares, and will have their farms free and a village lot free, worth at least $1,000. Even if the property were sacrificed at public auction and sold for one-half of the above sum, $75,000, which is only the value of the improvements, then the shareholders would get back $1,250 on each share, they would have a village lot worth at least $1,000 (and perhaps $3,000 or $4,000), which would leave them their farms at a cost of only $250. It ought not to be forgotten that the surplus wood on the tract is worth, in the tree, at least $50,000, which would yield a dividend of $833 per share, and that when the time comes for a division of the property among the shareholders, the premiums that will be paid for choice of lots will amount to a very large sum, all of which will be distributed to the shareholders. There are numerous elegant sites for fine country residences on this property, commanding most charming views of the surrounding country and the Russian River Valley, and among the wealthy subscribers to the stock of this Association there will surely be an active competition for these choice spots. The thousands of dollars thus obtained will of course be divided among all the shareholders, and will inure greatly to the benefit of those who do not bid for choice.

Such an opportunity as this to buy a country home in the most beautiful portion of California, and on terms such as will in reality prove in a few years a free gift, has never before been presented to the people of this coast; and it is safe to assume that not for many years to come can a combination of circumstances again occur to produce such results.

There are only sixty shares in the association for sale, and the wise will lose no time in examining the property and preparing to subscribe. It is believed that all the shares will be subscribed for early, and that in 60 or 90 days, when the public generally understand and appreciate this opportunity, these shares will be in demand at large premiums. The stock of this Association will be transferable, like that of any other corporation stock.

Prospectus of the Litton Springs Park Association.

The magnificent Litton Springs property, situated four miles north of Healdsburg, on the line of the San Francisco and North Pacific Railroad, to be sub-divided into small farms and sold on the installment plan. The property consists of 2,600 acres of beautifully wooded land, part bottom land and part low, rolling hills, with a little high land. There are a number of very valuable mineral springs on this property, including the celebrated Litton Seltzer Spring, the water from which, for years past, has been bottled and sold on this market, and deservedly stands at the head of the seltzer waters of this coast. The soda spring is admitted by all to be the most wonderful and valuable mineral spring in this State; the water is strongly impregnated with iron, and its tonic and valuable medicinal properties are so great that if it were bottled and placed on the markets of the United States, it would certainly yield a very large yearly revenue. The volume of water from this spring is so large that it is carried in pipes to the hotel, and is used by the guests for bathing purposes, thereby furnishing so luxurious a bath as to fairly eclipse even those of the ancient Romans. There are many miles of feucing and cross-fencing on this property, completely inclosing it. The property being proof against live stock from the outside, rules can be adopted controlling stock inside so as to do away entirely with unsightly fencing, and substitute the planting of hedges for division lines, which will add greatly to the beauty of the landscape. The improvements on this property are very valuable, and comprise one hotel building, nine cottages, barn, school house, bottling house, farm house, etc. The main hotel building is 64 feet front by 164 feet deep, and three stories high. The entrance hall is 20x44 feet, the parlor 20x44 feet, the billiard room 20x44 feet, and the dining room 32x60 feet, and is capable of seating 150 people. The rooms on the first floor are 16 feet high; on the second floor 12 feet high, and on the third floor 11 feet high. There are 32 rooms on the second and third floors, besides bath and servants' rooms. A piazza 12 feet wide surrounds the building on three sides. Gas and water are supplied to every room, and all are furnished with stationary marble-top basins. There are nine one-story cottages near the hotel, of various tasteful and convenient designs. A two-story building on the property is used as a school house. A substantial and well-finished three-story barn furnishes accommodations for a large number of horses and carriages. In addition, there is a house at the Seltzer Spring used in bottling the water, and a farm-house and vineyard at a little distance from the hotel. These buildings have all been erected within a few years, of the best materials, in the most substantial manner, and with a high degree of finish. This property is bountifully supplied with pure spring water from the numerous springs in the hills, the waters of which are carried in pipes to the hotel and hotel grounds, and may be conducted all over the property for the supply of houses and fountains. Fine well water can be obtained almost anywhere on the tract at a short depth below the surface. Fuel in great abundance can be found on this property. In addition to the beautiful oaks with which nature has so lavishly adorned this estate, manzanita, spruce, pine, laurel and other trees in great abundance are growing upon portions of this tract. It has been estimated by men familiar with the subject that there are now growing upon these 2,600 acres of land at least 50,000 cords of wood, and making the very lowest estimate of its value, which is $1 per cord in the tree, the wood alone would yield $50,000—leaving an abundance of oak trees for beautifying the landscape.

CLIMATE.—Much has been said and written about the climate of Santa Barbara, Los Angeles and other points in Southern California; and large towns have been built and are flourishing upon the business which their reputation for salubrious climate has brought them. While in no way gainsaying or calling in question the claim made by the admirers of the southern portion of our favored State, it is nevertheless a fact, well-known to nearly all who have been on this coast for any length of time, that the climate of the Russian River Valley, in its delightful and health-giving qualities, stands without a rival, and when the lethargy which has enveloped the people of that section shall have been shaken off, and its advantages made known it will be sought for as a health resort by people from every country under the sun. With regard to the

PRODUCTIONS OF SONOMA COUNTY,

It may be said every variety of grain, vegetable, fruit and flower that has been profitably grown in any other portion of California has been grown successfully in Sonoma County. Unlike the central and southern portions of the State, irrigation is entirely unnecessary here. Crops have never been known to fail in Sonoma County. An erroneous idea prevails among a certain class that semi-tropical fruits can be grown only in the southern portion of the State, but the fact is now becoming generally known that oranges and other semi-tropical fruits have been grown in large quantities in many of the northern counties, and as far north as Shasta County. It is also well-known that the choicest and earliest fruits brought to this market are produced within a radius of 100 miles north of San Francisco.

THIS PROPERTY MUST BE SEEN TO BE APPRECIATED.

Arrangements have been consummated so that passengers for Sonoma County can take the elegant, swift-going San Rafael steamer and connect at San Quentin with the cars of the San Francisco and North Pacific Railroad, and reach Litton Springs in less than three hours from San Francisco. By this route passengers can leave this city at about 7:10 A. M., remain at Litton Springs about five hours and return the same day. Round-trip tickets to Litton Springs Park and return are for sale at our office at $3. The new arrangement goes into effect June 1st, 1879. A more delightful excursion than this cannot be found anywhere else in the State.

The law under which this Company is organized provides that married women may hold such shares as they acquire with their personal earnings, or those of their children, voluntarily bestowed therefor, or from property bequeathed or given them, independent of their husbands. Ladies are therefore particularly invited to call at this office and obtain further information concerning this enterprise. The title to the property is absolutely perfect, being U. S. Patent.

Parties in the interior desiring to subscribe for shares in this Association can do so by first sending to this office for a blank application, to be filled out by them. They will then send their application, together with $500 as a first payment upon each share of stock they may desire, through the agency of Wells, Fargo & Co.'s Express, and the stock will be delivered to the Express Company for them upon the payment of the money.

If any further proof of the character of this enterprise were needed, it is only necessary to refer to the following names of well-known gentlemen of this city, who are the original shareholders and officers of this company:

DAVID BIXLER, Esq., of Williams & Bixler, capitalist; F. G. NEWLANDS, Esq., of Lloyd & Newlands, Attorneys-at-Law; GEORGE HEARST, Esq., Capitalist; MESSRS. POOL & HARRIS, Warehousemen; COL. A. W. PRESTON, U. S. Army; PETER DONAHUE, Esq., President of the San Francisco and North Pacific Railroad; President of the San Francisco Gas Company; LOUIS B. Beautiful lithographic maps and circulars of this property furnished, free of cost, to those who call or send for them.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

No. 417 Market Street, San Francisco.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

A CARD.

To Parties Interested in Mining and Milling.

Call at J. HENDY'S, N. E. corner of Mission and Fremont Streets, San Francisco, and examine COLEMAN'S PATENT SLUICE. It will save both float and flour Gold. The best system yet devised. No power required to work it. Examine it and judge for yourselves before purchasing elsewhere.

PAUL'S AMERICANIZED ARASTRA.

This is a cheap, first-class Pulverizing and Amalgamating Machine, and one by which the miner is certain to make money. With a crusher, it makes the cheapest and best kind of a Prospecting Mill; to use in connection with Stamp Batteries it has no superior. Call and see it, or send for circulars to ALMARIN B. PAUL, Room 20, Safe Deposit Building, S. F.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, JUNE 21, 1879. VOLUME XXXVIII Number 25.

Eaton's Improved Spoke Tenon Auger.

We illustrate herewith a device recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Robt. W. Eaton of Watsonville, Santa Cruz county. It is an improvement on that class of spoke tenoning machines which are intended to be clamped to the spoke, while the tenon is being made, and it consists in a novel construction of the cutter head, and in a means for adjusting and centering it upon the spoke. It also consists in novel means for adjusting the mandrel of the tenon auger, by means of swivel supporting rings, and operating screws, by which either end may be adjusted independent of the other, and any desired angle obtained.

As will be seen by the engraving a bar supports the boring augur, and is secured to the spoke, while the tenon is being formed. This bar is bent at right angles, as shown, and has a V-shaped groove formed in the enlarged face of this portion so as to clasp one side of the spoke. A stout loop or bail forms an arch from one side of the V-shaped groove to the other, and a block is fitted into this arch, so that a V-shaped groove in its face stands opposite the other V-shaped groove.

These screws to clasp the spoke, and a screw passing through the bail, may be turned to force the block inwards, and thus clasp the spoke securely in the double V-shaped groove formed between the two faces. The block is so mounted that it will adjust itself to the taper of the spoke when secured. Through the bar two screws pass at right angles with it and the spoke, and these screws have enlarged slotted ends into which the lugs or projections from two rings enter, and are screwed by a pin or pivot, so as to form a hinge joint, as shown. The rings serve to hold and guide the auger mandrel, and it will be seen, that by means of the adjusting screws one end of the mandrel or the other may be moved so as to give an independent adjustment to either end, and thus the mandrel may be set at any required distance from the bar, and also at an angle; as the hinge joints will allow of independent adjustments of the ends, a perfect aligment with the spoke is thus ensured.

The mandrel is hollow, and made in two parts, preferably of gas pipe, screwed together, and one part has a plug screwed or made fast into each end. Through one end a bar or rod passes, extending from the interior of one part through the plug, into the other part which supports the cutter head. A smaller rod or stem passes through the plug in the outer end of the mandrel, and has a neck or collar to prevent it from advancing.

It has a screw thread cut upon it within the mandrel, and screws into the rod so that by turning the head on the outer end, the rod may be advanced in either direction. By this means the gauge is formed, and the length of the tenon is determined and regulated.

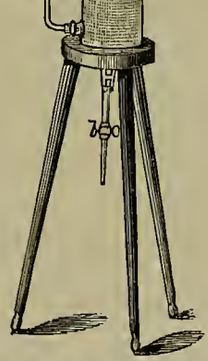
The tenon auger is secured to the end of the mandrel, and by means of the crank the mandrel and auger are turned, the auger cutting the tenon upon the spoke until the end of the bar strikes the end of the spoke and prevents cutting any further, as before described.

The auger or cutter head itself consists of two blocks fitted to slide in the guides so as to move to or from each other, as shown.

One of these blocks carries the knife which is secured to it by a set screw, and the face or portion of the block, which is opposite to the block, has one side beveled off, so as to make a sort of V-shaped projection. The other block has a V-shaped notch formed in its face opposing the block, so that the tenon entering between these two blocks has three points of support, namely, the surface of the block, formed by cutting off the incline, and the two sides of the V-shaped notch. As different sizes of tenon are cut, it will be seen that the points of support formed by the sides of the notch must be advanced more than the single face in order to keep the spoke and tenon in the center. This is effected by a peculiarly constructed right and left-handed feed screw.

This screw has one thread of a certain pitch working in the block, and the thread which feeds the block forward has a much more rapid pitch depending upon the angle of the groove or notch, so that this block is set forward faster than the other block, and this tenon will always be perfectly centered by this device, whatever may be its size. Set screws are turned up against the back, and support and steady the blocks, while a cut is being made.

This operation will thus be, to first prepare the spokes in the wheel in the usual manner, after which the machine is secured to each spoke successively. The cutter head being adjusted by setting the blocks at a suitable distance apart to form the desired size of tenon and the rod being set to gauge its length, it will only be necessary to turn the crank and rotate the cutter mandrel until the end of the rod comes in contact with the end of the spoke, when the tenon will be finished.



Eaton's Spoke Tenon Auger.

IMMODERATION IN EXERCISE.—This senseless "walking mania" cannot but be productive of harm to all who practice it. If generally adopted it will result in the development of some portion of the body to the detriment of some other. The physical and mental faculties must be equally exercised, or else nature's equilibrium will be destroyed, and the "human form divine" deformed. Let no person be persuaded that the "walking fever" is the inauguration of a proper system of exercise. It is simply a mountebank performance to gather the money of the morbidly curious; in other words it is an arrant humbug. If you have money to throw away, bestow it upon some deserving poor; if you need exercise, practice moderation and exercise all of the physical and mental capacities equally.

ATTENTION is being drawn by the Japanese emperor to the suicidal policy of exporting silkworm eggs for the purpose of providing the most formidable rival Japan can encounter, in the European markets with the means of producing a crop of silk in Italy one-third greater than Japan can raise under the most favorable circumstances.

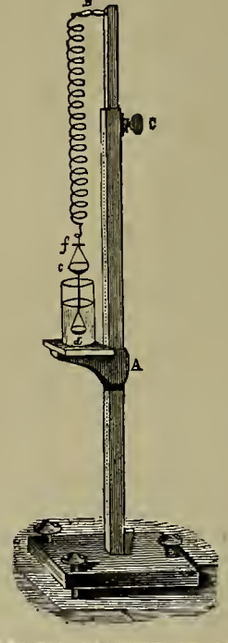
Specific Gravity of Minerals.

[Written for the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS.]

The following apparatus is exceedingly convenient for taking the specific gravity of large specimens of minerals, rocks, coal, gold, quartz, etc., and is almost indispensable in the laboratory and assay office.

I found it figured and described in "Traite Elementarie de Mineralogy," by M. F. Pisani, a celebrated mineralogist, geologist and teacher, of Paris. As it will no doubt be interesting to many of your readers, I gladly furnish you with a drawing, and the following translation from the publication mentioned:

Fig. 2.



APPARATUS FOR DETERMINING THE SPECIFIC GRAVITY OF ORES.

"Fig. 1 is an apparatus very practical, which I employ to determine the density of large pieces, weighing from 100 to 500 grammes. A bell glass with a tubulure at the top and one at the side is reversed as shown in the figure, supported by a wooden tripod. To the latter tubulure is adapted a bent tube, and to the lower opening, a tube and stop-cock of glass, *B*, very well puttied—the tube is made to tapser at the lower end.

"To use the apparatus: Pour into the vase a certain quantity of water and determine by means of a movable band of paper, the level of the liquid in the tube, *A*. Open for a moment the stop-cock of the tube, *B*, in order to prove that the tubes are all clean and unstopped, and readjust the paper gauge.

"To determine the density of a mineral: First, weigh it on a common balance, and then plunge it into the vase, supported by a fine wire or thread, when the level is raised in the bell glass, the water is allowed to flow into a vessel, graduated into centimeter cubes, until the original level is attained in the tube, *A*. The volume found in the graduate gives the weight of the water displaced, and furnishes data for the calculation of the density."

It will be seen that this apparatus is simple, can be made of any size, and may be improvised in an emergency. I have fitted up the apparatus, and have it in daily use. I can recommend it as admirably adapted for the purpose intended.

If any of your readers desire to see it in operation, I will be pleased to show it to them if they will call at my laboratory, 619 Montgomery street. It is due to the mechanics of San Francisco to say that they can make any kind of apparatus required, if it is properly described to them, and it seems strangely unwise to send to Europe or elsewhere for what can be made so well at home.

The above described apparatus is not adapted for taking the specific gravity of small bodies. To determine the density of fragments which do not exceed five grammes in weight, "*Jolly's Spiral Balance*," Fig. 2, is admirably fitted. The same work quoted above gives an engraving of this apparatus (here reproduced), with the following description:

"This balance is very convenient to determine rapidly the density of minerals. Its great advantage is that no weights are used. The results are only approximative, but are sufficiently correct to distinguish one species from another.

"It consists of a square wooden stand, to one face of which is a strip of looking-glass, upon which is attached a scale, graduated into millimeters. The stem is provided with a base and leveling screws.

"Along the stem is a sliding platform, *A*, upon which a vessel of water is supported. In the glass is sunk a little cup of glass, *a*, supported by platinum wires, and above it a metallic pan, *c*, also supported by wires of platinum. At *f*, is fixed a triangle of cardboard, which acts as a pointer. The whole is suspended by a spiral of steel or brass wire, from a projecting support, *B*, which slides in a groove in the stem, allowing the spiral to be fixed at any convenient hight, and held in place by the set screw, *c*.

"To use this instrument—take the first reading by bringing the pointer and its image in the glass to the same level while the cup, *A*, is immersed in the water in the glass vessel—this is done by raising or lowering the platform. The reading on the scale may = 'X,' the mineral fragment is then placed in the pan, *C*, and the platform moved downward until the instrument is again at rest; and the position of the pointer again taken = 'Y,' Y − X = weight in air. The fragment is then changed to the cup, *A*, and the reading of the pointer again taken = 'Z.' Then Y − Z = loss of weight in water. Divide weight in air by loss of weight in water to obtain specific gravity.

NEW GRAVEL MINING PUMP.—We some time ago made mention of a gravel pump built for a mining company operating on the gold-bearing bars of a river in South America. Another of these pumps has just been built by Mr. William Deacon, of the Main Street Works, for the American Mining and Dredging Co., who owns the patent right. This centrifugal pump differs in many important respects from the ones previously made. It has a suction pipe 13 inches in diameter with a 46-inch runner, and is driven by two high pressure engines 10x12 at a speed of 250 revolutions per minute. The pump is being set on a boat which was launched a few weeks since on that part of the Feather river known as the Lava Beds, about five miles below Oroville. The boat is provided with the most improved appliances to handle and bring it into position wherever needed. The calculated power of the machine is about 2,000 tons of gravel raised from a depth of 20 feet below the level of the water every 24 hours. The machine was built after the plans of the inventor, Mr. E. Moreau of this city. The machinery is nearly all in place, and will shortly be put at work in the river bed as stated.

CHARLES S. SARGENT raises a warning voice in the *American Journal of Science* against the wanton destruction of pine forests in Nevada. He says the forests of Nevada, consisting of a few species adapted to struggle with the adverse conditions of soil and climate, are immense and reach maturity only after centuries of exceedingly slow growth. On this account, and because, if once destroyed, the want of moisture will forever prevent their restoration either naturally or by the hand of man, he urges action to prevent the destruction.

SEVERE shocks of earthquake occurred throughout Costa Rica on May 29th and 30th. The cathedral in San Jose was partially destroyed. Slight shocks of earthquake were felt on the Isthmus of Panama.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Beet Sugar in California.

EDITORS PRESS:—In a former communication I promised to give the readers of the PRESS a detailed statement why, so far, the beet sugar industry in California, the same as in the whole United States, has made no headway, in fact, has been a failure. I have visited every beet-sugar factory which has been in existence in California; I have conversed with many people who have been directly and indirectly interested in them, and have thus been able to form an opinion, which, I think, is pretty nearly correct.

I know, in giving this opinion to the public, I run the risk of stepping on some gentlemen's sensibilities, and will therefore apologize beforehand, being unavoidable in order to adhere strictly to the truth. But before I give a detailed description of these beet-sugar establishments I will here first of all state some fundamental points on which my judgment is based.

Any beet-sugar factory established in California, or in any other State of the Union, if the same had been erected in the same style, with the same machinery, in any country where the beet-sugar industry flourishes, and could not have existed there, it could not have been expected to turn out anything else than a failure here. Any man who would not be entrusted with the erection and construction of beet-sugar works in a country which offers every facility for establishing beet-sugar works, ought not to have been entrusted with it in a country where the beet-sugar industry is new and has to overcome many obstacles unknown in old sugar districts.

To establish beet-sugar works with reasonable certainty that they will pay, four things are indispensable. These are: Beets, money, fuel and water. Of each of these four it requires a liberal supply; if either of them is wanting or but scantily supplied, failure certainly will be the result. Besides a liberal supply of these four articles, all of which exist in great abundance in California, it requires men who understand the business and also the English language, and know the country well enough to avail themselves of the great many advantages which the United States offer to the beet-sugar industry.

The sugar factories, which so far have been the representatives of this industry in California have been: Alvarado, Soquel, Sacramento and Isleton. Neither of these factories started on a sound basis, neither had money enough, while the first had a supply of fuel which was worse than questionable. In 1871, the two first-named factories were started, the one in Alvarado, under the management of a German, on the centrifugal system, the one at Sacramento under the management of a French count. Alvarado started a little the earlier, and was estimated to cost $75,000, while Sacramento was to cost only $15,000. No sooner did it become known that the French count could (or, better, would) build a beet-sugar factory for so small a sum, displeasure and discontent were manifested by the others that they had entered into a contract requiring five times as much money. There is very little doubt, had a change to the "French" plan been still possible, it would have been made, but though that was impossible, the seed of discontent once sown grows as luxuriant as the beets, which is saying a great deal.

The Alvarado Sugar Works worked well the first year and cleared a profit of from $15,000 to $18,000, while the Sacramento factory failed to make any sugar at all. The French count taking French leave has never been heard from since. The authorities are conflicting as to the system on which this factory was to work, the probability is it had no system at all.

The success at the Alvarado works undoubtedly encouraged the Sacramento Beet Sugar Company, they engaged an expert beet-sugar manufacturer in Germany, and imported a lot of machinery to take a new departure in the diffusion system. The machinery was badly proportioned and worse arranged. The various changes made by the seven different technical managers made only a bad thing worse, the expert sugar manufacturers were turned out, and others took the place, who understood little of the business, to be turned out again to make place for worse ones still. The places as foremen, machinist, etc., etc., were sold by those who managed the finances, the whole undertaking from beginning to end was a combination of imbecility, dishonesty and folly, which would have ruined any other business, however, profitable and simple.

It can not be denied that the Central Pacific railroad made great efforts and sacrificed large sums of money to make the sugar works at Sacramento a success; but all in vain, the factory could not have worked successfully in Europe if it could have been transferred, and corruption was the order of the day from the president to the night watchman. The bank which had advanced money on a mortgage foreclosed the same and sold the machinery.

Although the factory at Alvarado worked with a profit the first year, the discord amongst the owners prevented it ever afterwards, and caused the breaking up of the works and the removal of the machinery to Soquel, where it has existed for five years longer. It is intended to work but a few months this year, and that for the last time, after which it will be removed again. During the last season (the factory worked from August till March) the sheriffs had possession of it, which does not tell well for profit; but these beet-sugar factories have a peculiar "inwardness," which is next to impossible for outsiders, who are not in the "ring," to understand. The same parties who placed the sugar works in the hands of the sheriffs, work it this year for their own joint account.

To complete this little sketch, it remains to refer to the beet-sugar works, at Isletou. This factory has been built on the diffusion principle, and the main part is constructed very well. The capacity of the works is, under the best circumstances, 30 tons of beets per day. The troubles of this company began before the machinery arrived, which was embargoed in New York. This factory, like the one at Sacramento, had a great number of technical managers in a wonderfully short time. Had the works been finished in proper time, and began sugar making when finished, the company could still have done well. The beets raised on the island where the factory is located are of a very rich quality, and the crops always large and safe. But when the factory at last did begin to work, it had been in operation but a short time when a flood came, swamping the harvested beets, the beet fields which had not yet been harvested, and with it the company. The sugar made at Isleton has been of a superior quality, the trouble lying in the finances and the peculiar organization. The factory does not work this year, but the company hopes to reorganize.

A small number of gentlemen have entered into the beet sugar industry from purely patriotic motives, knowing it would bring blessings to the country, and they have sacrificed large sums; but the most have tried to make money out of their friends, caring little whether they made sugar out of beets, the money under any circumstances had the sweetness to them, though it proved very bitter to others and to the industry at large. But I am sure nobody can contradict me when I assert that not one of all the parties who have been in the beet-sugar business, in California, had any perception what a well-appointed, complete beet-sugar factory costs in Europe, and what it would necessarily cost here, otherwise they would never have ventured with $15,000, or even $75,000.

The machinery once at Sacramento has been transferred to the buildings at Alvarado, and such changes are intended as are required to make it in all its appointments, a first-class beet-sugar factory of a European model. The factory is to begin sugar making by the first day of September, and the beet crop promises to be an extra large one—probably from 20,000 to 25,000 tons.

It is to be hoped that the company has learned wisdom from former failures, and will not commit the same follies over again. The unqualified success of the Standard Sugar Manufacturing Co. would give new life and a new start to this industry in California. But few people have a conception of the magnitude of this industry in Europe. The following figures which are official may surprise them:

On the 4th and 5th of May, this year, the associated beet-sugar manufacturers of Austria celebrated the 25th anniversary of the organization of their society. Twenty-five years ago the beet-sugar industry was trying to gain a sound footbold; to-day it is the giant of all the industries in the empire. The following figures will give a view of the magnitude this industry has assumed in 25 years: Two million of acres are annually cultivated in beets by the sugar manufacturers themselves, and fully as many more by farmers who sell their beets to the sugar works. One hundred and twenty thousand workmen are permanently employed in the sugar factories; a large number of them are skilled mechanics. The value of land was, 25 years ago, from 70 to 80 florins per acre; now it is from 300 to 350 florins. The sugar factories fatten annually 70,000 oxen on the pulp from the beets. The sugar factories transport over the railroads annually from 3,500,000 to 4,000,000 tons of freight, amongst which is 1,000,000 tons of coal, which they consume. The tax gatherer has easy work in the sugar districts, as they are paying taxes readily.

The 229 sugar factories in Austria have not only supplied the entire home consumption, but they have exported 2,000,000 centals of sugar, importing therefore 42,000,000 florins of gold and silver. The permanent investment in machinery and buildings in these 229 factories is over 100,000,000 florins, and as large a sum in agriculture and working capital. This, then, gives an investment for each sugar factory, for agriculture, working capital and machinery, of 860,000 florins, or, in round numbers, $400,000 or $200,000 for machinery and buildings. Where then are our notions of $15,000 to build a beet-sugar factory with at Sacramento?

The sugar industry, either from cane or beets, is at present the largest industry in the world, and yields larger and safer profits than any other; and a great reason for this is that it cannot be done with small sums of money or by anybody who understands nothing of it, and this is also the reason that the demand for gold and sugar has been, for the last ten years, greater than the supply, while every other industry has been languishing.

ERNEST TH. GENNERT.

Alvarado, Alameda Co., Cal.

The Mineral King Mines of Tulare Co.

EDITORS PRESS:—Now that work is about to begin in earnest and on a large scale in the Mineral King district of this county, your readers may be interested in a description of that promising mining region, which I have had the good fortune to obtain from an intelligent prospector and observer, who has been intimately acquainted with that part of the Sierras for six years past.

First, it should be known that our enterprising friend, Senator Tom Fowler, is having his new wagon road to that wild mountain district pushed to rapid completion. Ten miles of it are already finished, and work is progressing along the remaining miles, so that the latter part is likely to be finished before the Fourth of July. He has

A 30-Stamp Mill—

Formerly used in Nevada county—waiting at the Visalia R. R. depot, to be hauled to the mines as soon as the mountain road is done. This mill, designed to crush the ores of Fowler's Empire mine, is to be erected at Harry's Bend, a central point in the Mineral King district.

Now for the description of the geological features, and the metallic deposits of this region, which is doubtless destined to become famous among the many noted mining districts of the Pacific coast.

My informant is Mr. J. P. Ford, whom I had the pleasure to make a Granger at Plano on Tule river five years ago. He was one of the early discoverers of the Mineral King district. He now spends his summers there prospecting, and his winters in Hanford, carpentering. Since 1873 he has, according to common consent, thoroughly examined that whole mineral belt, which by his kind information I shall now describe.

The Extent of this Mineral Belt

Proper is about 12 miles long and 3 wide, its center being some 50 miles east and 15 miles north of Visalia. Its general course runs west of north and east of south—with the usual trend of our mountain ranges—at an angle of about 24°. There are not less than six true fissure veins in the district.

As regards its geological character, the leading formations consist of carbonates of lime, mica schist, or mica slate, gneiss, syenite and porphyritic rocks, including several strata of trap rocks. These porphyries and traps are the only signs of any later volcanic action in this mineral district. Mr. Ford has found no form of lava, no *scoriæ*, no pumice-stone, no lava. Yet almost in a straight line between this region and Mt. Whitney—some 18 miles northeast of the former and 12 southwest of the latter—he assures me there are large masses of obsidian or smoky quartz—whichever it will prove to be. Some boulders of it are from three to five feet long, and are occasionally so vitreous and transparent, that through pieces from six to eight inches thick you can see the hand moved to and fro, and even distinguish the finger-nails.

We have mentioned

Six True Fissure Veins.

Of these the White Chief, the Lady Franklin, and the Empire are the largest. The White Chief is on the extreme western boundary of the district. Its ores are sulphuret of lead (galena), and sulphuret of zinc (Black Jack of the miners), in combination with silver. The Lady Franklin and Empire veins are near the center of the mineral belt, along a west and east line. The Lady Franklin ore is sulphuret of lead, with silver and iron. The ores of the Empire mine are of an entirely different character, comprising carbonate of lead in small quantities, and ruby silver, with some base metals and gangue rocks. In the Black Wolf are found copper with sulphurets of iron and silver, copper being the chief element, amounting sometimes to 50%. Another vein, called the Chihuahua, is rich in silver and lead, and contains a large percentage of antimony. In this ore the sulphuret of lead sometimes amounts to 80%. A small vein, called the Crystal lode, is richer in lead and silver than any yet discovered.

Besides the above, there are many

Other Veins Appearing on the Surface

That have not yet been proved to be fissure veins. Among these, Amalgam Hill lode bears strong evidence of being a true fissure vein, and so does Mineral Hill lode.

Along the eastern boundary of this mineral belt, a large and well-defined lode of plumbago has been found during the last 18 months, and some specimens of it are found to contain as much as $64 of silver per ton.

With reference to amounts of ore, we may state, that, on the dump of one claim of the White Chief lode, at least 1,000 tons of ore can be seen; some say as much as 1,500 tons. Assays of this ore give as high as $300 per ton silver, and none less than $40. On the dump of Lady Franklin lode, from 300 to 500 tons of ore can be seen. Its average assay is $80 silver per ton, and some 22% lead.

A Number of Tunnels

Have already been run, as follows: In the White Chief there is one about 280 feet long, the ore not yet reached, and work at present suspended. In the John Franklin lode—probably a slide or surface lode—a tunnel has been made over 70 feet. The longest tunnel yet constructed is in the Empire lode. It is already about 480 feet long, and is being pushed ahead at the rate of more than three feet every 24 hours. On the Black Wolf, one tunnel has been run 80 feet and work stopped, but on another part of this lode, a second tunnel is being pushed ahead night and day by Samstage & Co., and is now in about 100 feet. There is an important tunnel, intended to crosscut several lodes, now in about 200 feet, and owned by the New England Tunnel and Smelting Company.

Improvements in this New Mining District

Are few as yet, but among them is a good sized and convenient public house, kept by E. S. Smith. Three years ago a saw-mill was put up near Harry's Bend. At least 100,000 feet of lumber have already been sawed and used.

Two years ago last fall, a water-jacket blast-furnace, with a Sturdevant blower, was erected by this New England Co. The general belief is that this machinery has not been properly handled to develop the real capacity of this mineral belt, and for reasons best known to said New England Co. They certainly failed to make bullion, but this failure is generally believed to have been intentional. What could have been their object? Apparently, to gobble up all floating stock, and thus to monopolize the property—"the old, old story" of joint stock companies in general.

Much interest is taken in the first work of the 30-stamp mill, which will soon be ready to work

The Empire Mine Ores.

The latter have yielded, in assays on which Mr. Fowler relies, an average of $121 per ton, silver. It may be well to state that several of the most rebellious ores of this district are now being tested by a new process. The result is watched with interest, and will be known in a few weeks it is hoped.

Before closing, it may be best to say about the geological formation of this district, that gneiss is found only on the west wall of the White Chief lode, and it forms the west wall of this mining district. This gneiss extends between a quarter and a half mile west, and is backed up by masses of granite. On the eastern side of this district, this massive granite also unites with the porphyritic rocks.

In several spots near the western limit of this mineral belt, some loose, large boulders, of gray and yellow rock like serpentine, are found. In one place near the eastern limit, considerable hornblende exists. It is also an interesting fact, that near the center of the district, there is

A Large Deposit of Magnetic Iron.

Which can be made useful, if combined with silica to form a flux for the absorption of sulphur from the numerous valuable ores.

Mr. Ford, from his intimate acquaintance with this mineral belt, is satisfied that in the next 10 years the mining property there will exceed the value of all other property in Tulare county, even if we rate unirrigated railroad lands at $20 to 40 per acre. He believes it will soon rival the Virginia City silver mines in their best days. People are only waiting for the completion of the new wagon road, and then we may look for an eager rush to the new mining region, like the old rush to Cariboo, to White Pine, to Virginia City, to the Black Hills, and to Leadville.

For the sake of this very promising part of California, both as regards our agricultural and mining interests, we earnestly hope the brightest of these anticipations will be realized.

Hanford, June 9th. J. W. A. W.

AZTEC RUINS.—A singular ruin stands on a little hill near the north bank of the Gila river, three and a half miles from the new railroad station at Gila Bend. Surrounding a space of two or more acres are stone walls, still standing to a hight of three or four feet, enclosing some twenty rooms and a peculiar structure which can readily be imagined to have been an altar. It is a perfect circle, within which lines of stones describe two equilateral triangles intersecting each other and forming a six-pointed star. At each point of the star, and in its hexagonal center are small circles of stones. Upon a rock near this structure is cut the figure of a man with outstretched arm pointing to the north. There is little doubt that excavation of the debris surrounding these ruins would disclose implements and other relics of a long forgotten race.—*Arizona Sentinel.*

RAILROAD GAUGES.—Two or three instances in which the gauge of roads has been changed from three feet to four feet eight and a half inches have been cited to prove the failure of the narrow gauge. What, then, is to be inferred from the fact that the Cherokee railroad in Georgia, which now has a gauge of five feet, is to be changed to the three feet gauge? We apprehend that because one gauge is suited to a certain locality, it does not follow that it is the only proper gauge for all the other roads in the world—or *vice versa.*

H. W. VOGEL has photographed the spectrum of pure oxygen, using for the purpose the gelatine bromide of silver plates prepared in England. These plates have only recently been introduced, and are said to be 15 times more sensitive than the most sensitive wet plates. The photographs will soon be published.

SOME 50 new species of fish have been discovered in our Atlantic waters during the year 1878, by the labors of the U. S. Fish Commission. A full description and classification of these important discoveries will appear in the publications of the U. S. National Museum.

MECHANICAL PROGRESS.

A Rapid Voyage.

The "fastest run on record" has just been accomplished by the English mail steamer *Durban*, Union Steam Company, Capt. A. S. Warleigh, with telegrams from the seat of war at the Cape. Leaving Table bay a little before 8 P. M., on April 1st, the steamer soon settled to her work, and before 11 on the following morning she had overhauled and passed the *Edinburgh Castle*, which had left the Cape Town docks fully three and one-half hours before her. Noon of this day disclosed the fact that she had run a distance of 221 miles during the previous 16 hours, or close upon 14 knots an hour. A light, favoring breeze springing up steadied the action of the screw, and the recording slate at noon of the following day conveyed the welcome intelligence that she had run a distance of 338 miles, or 14.1 knots an hour. The nine following days told almost the same tale, and at the close of the tenth a total of 3,231 miles was reached, giving an average speed of 323½ miles per diem, or 13½ miles an hour, a result never before attained by any of the steamers of this or the Donald Currie line, and not excelled, I believe, by the famous Cunard line, and this without the aid of any favoring breezes, which failed after the second day. Throughout the four following days she encountered a succession of head winds, head seas and opposing currents, but notwithstanding this the steamer kept up an average of 298 miles per diem, and Madsira was reached on the latter part of the 14th day. After remaining at that port for four and one-half hours, the steamer proceeded on her course across the dreaded Bay of Biscay to Plymouth, which she reached at 6 P. M. on Sunday, the 20th ult., thus performing the whole distance of about 6,000 miles in 18 days and 22 hours, inclusive of all stoppages, and actual steaming 18 days and 16 hours, or 13.1 knots the whole voyage. This result eclipses anything on record in steam navigation. Half the distance has been frequently done in less time by steamers of this lines to New York; but it must be borne in mind that it is a far easier task to run 3,000 miles in nine days than 6,000 miles in 18 days, as the *Durban* has done, coals having to be carried for this long distance, etc.

Steel Wire Belts.

From the *Gewerbe Zeitung* is taken the following account of steel wire belts, designed to take the place of leather belting: These driving belts are of the best crucible steel wire, in transverse network of one to two wires, in any desirable length and width. The two ends of the belt are joined like the middle, so that there is no beginning and no ending, the belt forming an endless band. These belts are not to be confounded with flat wire ropes, which, in consequence of the wires running parallel, longitudinally, are stiff and immovable. All the wires run parallel only across the width in such a manner that one wire catches into the other like a spiral, a continuous densely-woven chain being thus produced, the movability of which is so great as to enable it to go round the smallest pulley. The straps are also made with leather or elastic lining, or bordered with leather, elastic, hemp, hair taps, or any other material, also its interstices filled with gutta-percha, to prevent their stretching. When large and broad belts are employed, the lining of leather or other material may be omitted. The journal quoted makes very positive assertions of the advantages of these belts, claiming that they are in every way superior to all flexible transmitters of motion heretofore employed.

BENDING TIMBER.—The usual process of bending hard wood, especially beech, by means of hot water or steam, is known to be somewhat costly as regards fuel, and moreover requires a long time. But an invention has recently been brought forward in Germany, it appears, for making sieve hoops and similar objects by a dry process, more cheaply and in less time, from simple cut wood. Two rollers are employed in the operation, one above the other, and having less velocity, so that the upper acts by holding back, while the lower extends the wood fibers. When the board, thus bent, leaves the rollers, it is fastened in the mouth of the sieve; the upper roller is fluted, the under one smooth. If two smooth rollers were used, a very much greater pressure would, of course, be required.—*American Builder.*

AMERICA'S FIFTEEN INVENTIONS.—An English journal frankly gives credit to American genius for at least 15 inventions and discoveries which, it says, have been adopted all over the world. These triumphs of American genius are thus enumerated: First, the cotton gin; second, the planing machine; third, the grass mower and grain reaper; fourth, the rotary printing press; fifth, navigation by steam; sixth, hot air or caloric engine; seventh, the sewing machine; eighth, the India rubber industry; ninth, the machine for manufacture of horse shoes; tenth, the sand blast for carving; eleventh, the gauge lathe; twelfth, the grain elevator; thirteenth, artificial ice manufacture on a large scale; fourteenth, the electro-magnet and its practical application; fifteenth, the composing machine for printers.

New Buoys.

The immense oceanic traffic, with its attendant dangers, and frequent terrible loss of life, has brought much inventive labor to bear on the construction of signals and buoys. The means hitherto used to warn ships on the approach of dangerous places, may be divided into two classes, namely, such as can be seen, and such as can be heard. Lately improvements in both these directions have been made in application to buoys. A Belgian engineer, Pintsch, has constructed a buoy the body of which serves as a reservoir for 300 cubic feet compressed illuminating gas, and from this a self-regulating lamp attached above this buoy is supplied. The supply lasts for three months, and the light is visible to a distance of six or eight miles. The cost in England was found to be three to six pence in 24 hours. This undoubted merits of this invention have led to the conviction that these buoys are capable of displacing the expensive lightships, for it has been amply shown that the light is not extinguished in the most severe storm, and that aside from the quarter-yearly filling with gas, they require no other attention whatever.

Mr. J. M. Courtenay, in the invention of the buoy bearing his name, assumed that no light, not even the most powerful electric, could penetrate a dense fog; he therefore provided his buoy with an automatic alarm signal. Projecting downward from the air chamber of the buoy is a long tube, open at the bottom, and closed at the top by an arrangement of valves. The rising and falling of the column of water in the tube performs the function of an air pump, the exit of the compressed air being through a locomotive whistle of 10 inch diameter. The signal can be heard two to four miles. The lighthouse board of our government intends to introduce an ingenious combination of the above mentioned systems of buoys, thereby making the advantages of such subserve to increased maritime safety. We understand the new buoy is to be used on the Pacific coast.

NEW RAILROAD TIE.—At the regular monthly meeting of the Engineer's Club of Philadelphia, a model of an iron railroad tie, which is being tried on the Philadelphia & Baltimore Central railroad, was exhibited. The device dispenses with all spikes, bolts, nuts, or fish plates, and drilling or punching the rails, avoiding fractures from such causes. The iron tie, it is claimed, will outlast 12 renewals of the ordinary tie at one-half the cost to keep in repair. Each tie is recessed under its rails, and along the bottom of the recess wedge-shaped pieces are cast transversely. At the sides of each recess are creosoted blocks, which form a cushion and a fulcrum for two clamps, which grasp the flange and web of the rail above, bearing upon opposite faces of the wedge below. The weight of the train forces the clamps upon the wedge, spreads them at the bottom and grips the rail. The first cost is somewhat greater than the wooden tie, but it is said to offset this in durability.

DELICACY OF THE MINT SCALES.—New Orleans *Times:* The fine gold-weighing scales made in Philadelphia for the New Orleans mint, and placed in position recently, are marvels of mechanical invention and accurate workmanship. The larger of the two has a capacity of 10,000 ounces Troy, or about 686 pounds avoirdupois, and, when loaded to its full weight, will indicate a variation of one thousandth part of an ounce, or the millionth part of its weighing capacity. Another pair of scales is the one intended for weighing gold only. It has bearings composed of the finest agates, which have been ground with wonderful precision. So delicate is this machine that it will give the precise weight of a human hair, and is susceptible to the slightest atmospheric changes. Millions of dollars worth of precious metals will be weighed annually upon these scales.

TIDE-WATER PIPE LINE.—This line is now completed from Coryville, Pa., on the McKean & Buffalo road, to Williamsport, about 100 miles, and the first oil was pumped into it May 28th. It is designed to be an independent line, and will deliver its oil at Williamsport to the Philadelphia & Reading road. It is of six-inch pipe and has an estimated capacity of 6,000 barrels a day. There are two pumping stations, one at Coryville and one at a point 22¾ miles east. The line has been an expensive one to build, passing over a rough and hilly country, to and through which the transportation of the pipe was costly and troublesome.—*Railroad Gazette.*

THE MICROPHONE IN MINE DISASTERS.—The buried miners at Sugar Notch tried very hard, by pounding on the walls and doors of their rocky prison, to let their friends outside know they were alive, but did not succeed. The question is raised whether the long and distressing uncertainty as to their fate might not have been relieved had a microphone been employed. Also whether it would not be possible to devise and make known to all workers underground a simple code of microphonic signals, to be communicated by rapping and heard by means of the microphone, whereby some sort of intercourse might be kept up between those without and those within a mine under such circumstances.

PNEUMATIC TUBES.—A system of pneumatic tubes took the place of telegraph lines in Paris on May 1st, for the transmission of messages from one part of the city to another. The charge is 50 centimes, or 10 cents, for open, and 75 centimes for sealed messages.

SCIENTIFIC PROGRESS.

Scientific Incredulity.

In the recent achievements of mechanical and scientific processes, the mind naturally reverts to that period of time when successful experiments existed in an embryotic, ideal condition. Then, the suggestion, merely, of ideas that have fructified into all the elements of society, so necessary to its comfort at the present day, was the suggestion of impossibilities. Science had then arrived, as was generally believed, at the limit line, beyond which was the unknown, the impossible. In spite of the perfect stats at which purely speculative philosophy had arrived, the mind absolutely refused to combine with matter, the intangible with the tangible, and yet, physically speaking, the latter was the all-important. It was forgotten that all things were possible, and that portion of the cerebrum, which should have contained the knowledge of the distinction between essences and prototypes, was a void, waiting for genius to fill it with possibilities *ex nihilo*.

What a storm was raised about the theory of spontaneous generation, yet the scientific language of Darwin was clear enough. He laid down no more than Ponchet had actually demonstrated with his microscope years before, to wit: That certain organized beings have no known progenitor. There was no denial of the Creator, merely a misunderstanding of terms. It is a fact that railroad trains at full speed travel around sharp curves in perfect safety, and yet no less a man than Stephenson disputed it, and demonstrated it to be impossible. The uses of steam, of electricity, of all of the now practically useful contrivances, have at some period received a backhanded blow from scientific incredulity, yet the world moves. We deny that there is any limit to scientific possibilities. Of course we do not fail to distinguish between a change of essence, as a square circle, and the realization of an ideal prototype. And in the light of all present developments there is not surely room for derison in the direction of any theoretical mechanical or scientific ideas.

Had the *vox populi* prevailed, we would now have been groping our way in blissful ignorance of the wonderful, nay mysterious elements, practically applied in every department of our affairs. We must advance, for we have gone too far to retrace our steps even if we would. Those who caviled then, still live to cavil now, and with a pyrotechnic display of printer's ink, decry this and that from a standpoint of pure invincible ignorance or deep-seated jealousy. Whether Kesly's or Gray's motors become of any practical benefit or not, they are well worth the trial. If they should succeed, cavilers will applaud; if they fail, "I told you so," will be the epitaph scientific, or rather unscientific, incredulity will place upon the grave of labor and research for man's physical welfare.

How often is the germ of an idea, fecund with future mechanical or scientific possibilities, hoen crushed in its inception by the jeers of the skeptic. A monomaniacal, visionary scheme, true, but a man of one idea is generally the successful man; a monomaniac, but with method in his madness. All schemes remaining locked up within the recesses of the mind are essentially visionary, but their practical development dispels the odious signification unjustly attached to the word. Varied accomplishments are brilliant like the rocket, but end in a poor stick after all, unlike the still, persistent glow worm, to which may be likened the unobstrusive visions of the inventor having one idea. Let the incipient inventor be encouraged, and let his scheme and plane be assisted at least by a negative assent, and not derided, lest we destroy the future of some scientific wonder. *Cui bono* the spectroscope? A child's toy, to please its fancy with imitation rainbows; its value in the arts has removed all incredulity. *Cui bono* spontaneous generation? It led a Salisbury to the cryptogamic theory of malarial diseases and their cause and cure, and will yet lead to the destruction of the dread diphtheritic bacterium. Truly scientific incredulity is a fact!

SCIENCE AS A DETECTIVE.—An emery wheel, guaranteed to stand 600 revolutions, was run at the speed of 1,000 revolutions, and burst, doing a large amount of damage. A suit to recover was instituted, based on a letter written by the seller of the wheel, in which the strength of the wheel was rated at 1,600 revolutions. While in the office of the prosecutor endeavoring to effect a settlement, the defendant observed that a certain make of ink was used, and he learned by a casual inquiry that the same ink was used exclusively by the prosecutor. The defendant had for several years used another ink. Taking samples of the two inks to a chemist, he was able after analysis to secure a solvent for the one which would not affect the other. The case came to trial. Evidence was taken as to the kind of ink each party employed. Then the chemist was called, and in the presence of the jury applied the solvent, which removed the interpolated "1," and left the rest of the writing untouched. The proof of the forgery was sufficient, and the case was dismissed, leaving the dishonest prosecutor to defend himself from a criminal charge.—*Scientific American.*

Another New Metal.

The services the spectroscope is capable of rendering to science become more and more evident daily, the latest proof of the fact being the discovery of a new metal called scandium. In some of the mines in Sweden and Norway small quantities of earthy minerals are found, called gadolinite and euxenite, composed of oxides of very rare metals. The bulk of the substance is of a rose color, arising from the presence of erbium, and is called erbine. At first it was supposed to be simply mixed with some earthy substances which rendered it impure, but not long ago M. Marignac discovered the presence of another metallic substance, which he called ytterbine, the oxide of ytterbium. However, great uncertainty existed as to the composition of these bodies, and M. Nilson undertook a series of experiments on the subject. M. Berthelot, at the last meeting of the Academy of Sciences, gave an account of what had been done so far, the result being the discovery of a new metal to which M. Nilson has given the name of scandium, to indicate that it is of Scandinavian origin. Erbine is, as before mentioned, of a brilliant rose color, while ytterbine is white. But the separation of the two substances can only be effected with extreme difficulty. The earth has to be dissolved in boiling nitric acid, and the ytterbine then precipitated by sulphuric acid; and M. Nilson found that the operation, repeated more than 20 times, did not completely separate the two bodies.

When he had obtained a comparatively pure ytterbine he commenced an examination of it, and then he found that it gave absorption bands in the spectrum unknown to any substance previously examined. After repeated trials he became convinced that he was dealing with a metal never before suspected, and he continued his researches. He is unable to say at present what may be the chemical properties of this new body, as the quantity of material at his disposal was insufficient to allow him to isolate the metal. Nor can he decide as yet as to the place this new metal is to take among the older ones, but he considers that its properties differ materially from those of erbium and ytterbium, and that it should rank between tin and thorium, as the atomic weights of these two are 118 and 234, while he calculates that of scandium at from 160 to 180.—*Scientific American.*

HEMACITE.—The progress in the utilization of waste products is manifested in a striking manner by the manufacture of a peculiar substance from the blood of beeves, called hemacite. Although much incredulity has been expressed concerning its utility, it appears to be successfully established that an article of fine appearance and utility can be made of blood, either as an entirety or after the elimination of its albumen. After continued experiments, it was discovered that by mixing this blood with certain pulverized mineral and vegetable substances, singly or in combination, and the resulting mass triturated to a fine powder, and then subjected to a powerful mechanical treatment, it could be formed into a great variety of useful articles. Scraps of paper, leather or cloth were used in place of this pulverized substances mentioned, with the same result. For different colors, however, the mineral or vegetable powder must be used in combination. Many goods are now in market made of hemacite, which were formerly made of vulcanized rubber. The Dibble Manufacturing Co., at Trenton, N. J., having been compelled to provide specific machinery, is now in full operation and doing a large business.

CHLORIDE OF MAGNESIA IN GAS METERS.—Owing to the difficulty and expense of obtaining a good dry meter wet meters are still largely in use, and the question of what shall the liquid be is an important one. Water is, perhaps, the worst possible filling; it freezes in winter and evaporates in summer. Alcohol is free from the former disadvantage; but not from the latter. Glycerine, the use of which was first proposed by Prof. H. Wurtz, is better than either. A solution of chloride of magnesium has also been tried and found to be excellent, when the gas is free from ammonia, which is, unfortunately seldom the case, as the white spots on our argand chimneys tell us. Goebel has tried chloride of magnesium, and found that when there is only 0.3 gramme of ammonia in 100 cubic meters of gas serious results follow in a few months. A part of the salt is decomposed, forming sal ammoniac, which combines with a second portion of the former to form a double salt, magnesia being precipitated as white powder on the clockwork and wheels. The double salt subsequently decomposes, liberating hydrochloric acid. Chloride of magnesia is most effective in purifying gas from ammonia.—*Scientific American.*

VANILLA FROM OATS.—From oats a substance is obtained having the odor of vanilla, by subjecting the husks to an extractive process similar to that used for obtaining the glucose from chiccory blossoms. The substance thus obtained is odorless, but when its aqueous solution is subjected to an oxidizing process, it is transformed into a material having the odor of vanilla, which can be separated from the water by the use of ether, and further purified.

The Mining Share Market.

The stock market during the past week has had a general downward tendency whenever the slightest opportunity offered. While there seems to have been sufficient confidence in some of the mines, developments are at a standstill. Although some stocks have taken a sudden rise, there is a fear that the rise is not caused by healthy conditions, and hence a fall is apprehended. Everything being in readiness for the Sutro tunnel opening, there will not be much movement in some directions until its effect has proved to be beneficial. It may be that Eastern manipulators have something to do with the present condition of things. Indeed, it is quite likely they may be justly accused of any shortcomings. The bugbear of capital being withdrawn from the State on account of the new Constitution being still hammered at in the East, bears all the semblance of truth, on the false principle that persistency in a deception finally arrives at truth. The fact, however, that Eastern capital seeks investment in our mining shares, would seem to indicate few valuable openings in the East, so far as speculative opportunities are concerned. Money follows the general laws of trade and seeks the most favorable opportunities to increase. Hence, there need not be the slightest ground to fear anything for the future welfare of our stock market. But we warn all, as we have repeatedly heretofore done, not to permit themselves to play the cat, and pull the chestnuts from the fire for Eastern capitalists. Watch wildcat schemes, and denounce all attempts at bulling the market. Since having driven out one devil, it will be wise for us not to harbor seven new ones, lest our latter end be worse than our first. It is well at all events to rally around our own interests and, without selfishly crowding out outside investors, preserve our own home affairs in a healthy, moral condition. We invite capital, and do not seek to hinder it from coming here, and all of our strictures must be regarded of having reference to our great desire to make investments in our mines as sure as investment in any other business.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

California, June 11th, $13,862.03; Bulwer, June 12th; $17,253.30; Standard, June 12th, $19,767.48; Northern Belle, June 11th, $2,370.67; Con. Virginia, June 11th, $83,169.64; Indian Queen, June 9th, $3,602.41; Bodie, June 17th, $36,000; Sierra Nevada, June 17th, $60,388.77; Alexander, June 12th, $7,100; Standard, June 11th, $17,529.39.

Negotiations begun 18 months ago for the purpose of securing to New York a grand obelisk now standing at Alexandria, Egypt, are successfully terminated. The Khedive has offered the monument to New York. Official papers to that effect have been received at the State Department.

Subscribers of the Press who would like a copy of Paul's pamphlet on Dry Amalgamation, can obtain one free by sending their address to Almarin B. Paul, Room 20, Safe Deposit Building, San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Items.—*Ledger*, June 14: The cam shaft of the Bunker Hill mill broke Wednesday night. The mill is now idle, and must remain so until the shaft can be repaired. At Drytown, Collins & Misner, owners of the Exchange mine, have commenced work on their claim. There is No. 1 rock in the mine, with a ledge about four feet wide. They had some rock crushed about a week ago, which payed from $6 to $8 per ton. The Talisman mining company is now paying off its debts at the rate of 20 cents on the dollar, and will commence next Monday to sink their shaft 200 ft deeper. The Victoria mine, on Dry creek, was sold on the 12th instant to a company of San Francisco capitalists, and the new company are now negotiating with the Crown Point mill for the crushing of 200 tons of the rock, which, it is calculated, will pay $6 per ton on an average.

Monterichard. The east drift from the Monterichard mine, at the 350 level, is now in about 20 ft, at which point they have a ledge of fine looking rock from two and a half to three ft wide.

BUTTE.

Mining Matters. Oroville *Mercury*, June 13: The Wyandotte hydraulic mining company made a partial clean-up Friday, obtaining $1,300 in fine gold. During the 15 days ending last Friday, the bank officials purchased $9,000 in gold dust from individual miners working in this vicinity. Howell, Bassford & Co., of Colusa county, are reopening the old Eagle tunnel, which has lain idle for 17 years. The property is situated on Little Butte creek, about three miles above Dogtown, and is believed to be very rich. Machinery to drain the tunnel is now being put up Monday the Powers company shipped a retort valued at $2,500, as a result of ten days run.

CALAVERAS.

Champion Mine.—*Chronicle*, June 14: It has been our pleasing duty to record many rich yields of Champion rock, but we believe the last clean-up shows a better average per ton than any one previously noted. Thirty-five tons of rock netted $4,000! An average yield of over $114 per ton! Enough second-grade ore was subsequently crushed to swell the aggregate clean-up to something like $6,000. The main shaft of the Champion is now down 500 ft, at which depth levels have been run and stopes opened. The vein varies from 10 inches to 2½ ft in width. The mine is looking better than ever before in its history. The mills are kept in constant operation, a sufficient force being employed in mining ore to keep the batteries continually employed. Mr. Samuel Haskins, one of the proprietors of the Champion, who was here Sunday en route to San Francisco with a cargo of bullion, exhibited some very rich specimens of ore from the 500 level.

Fatal Mining Accident.—A miner named James Smith, an old resident of Angels, in this county, was instantly killed, on Friday of last week, by the caving of gravel upon him. We take the following details from the *Echo*, of Tuesday: Mr. Smith had just gone to work after dinner, in an open cut some 15 ft deep. The tub was lowered, and just as he was in the act of filling it, the bank caved from above, covering him over five ft deep, and literally crushing his skull. The alarm was given, and in a few moments 20 or 30 miners were on hand digging as rapidly as possible, still it took nearly two hours with all their exertions before they could get him out. When found he was standing against the bank opposite the cave, shovel in hand, as if in the act of shoveling into the tub. From the position in which he was found, it is quite evident that he was not aware of his danger until it was too late to make an effort to save his life.

EL DORADO.

Hauling Rock.—*Democrat*, June 14: Several parties are now engaged in hauling rock to Longley's mill, at Glencoe. Sundermyer & Co. have some 60 or 70 tons of good ore ready for crushing, and parties owning a mine near El Dorado are also engaged in hauling to the mill.

MONO.

Bodie Mill.—*News*, June 12: Col. Fogus, superintendent of the Bodie mine and mill, informs us that everything is running smoothly at the mill, and the ore being crushed will result in one of the biggest clean-ups of the season.

Real Del Monte.—We are informed by George Daly, superintendent of the Real Del Monte, at Aurora, that it is his intention to put in a 17-inch pumping gear, in order to handle the immense flow of water which impedes operations in the mine. This pump will be the largest of any in use in this section of country, and equal to any on the Comstock.

Tioga.—A double-compartment winze is down 55 ft on the footwall, on the line of the lode; clean ore six ft in width, of good grade.

Jupiter.—Shaft down 250 ft, 4x4½ double compartments—with crosscuts, drifts and ledges. The Masten ledge, 40 ft south has 2 ft of clean quartz. Daly ledge, somewhat broken, but assays as high as $70 in silver.

Dudley.—The 50 and 80 levels have developed a large body of ore of good milling grade, very high both in gold and silver. Some ore assays wholly in silver, carrying clean horn silver. Other ore assays high in gold and nothing else; still others assay in both metals. Three samples assayed as follows: No. 1, $400.10, silver, including horn silver in very substantial form; No. 2, $175.40, gold, and $597.30, silver—total, $772.70; No. 3, $507.89, silver and $190.50, gold—total, $788.39. There are much higher assays obtained.

Noonday.—Three compartments down now 90 ft. North drift on 200 level shows a ledge of good ore.

Defiance.—Shaft down 147 ft in the ledge footwall.

Queen Bee.—North drift in 210 ft; entirely silver bearing ore, without any wall on either side. Ore assays $5 to $35, all silver.

Brooklyn Con.—Quartz shows free gold without the aid of a glass.

Bodie Tunnel.—This tunnel is now in 1020 ft, with face in excellent vein-bearing formation.

Orient.—Shows a good ledge of milling ore.

Bullion Shipments.—*Standard*, June 13: The bullion shipments from Bodie district, through Wells, Fargo & Co., from the 1st to the 12th of June, have been as follows: Standard, bars, No. 132, $21,192.34; No. 133, $20,701.57; No. 134, $17,520.30; No. 135, $10,707.48. Total, $79,250.78. Bulwer, bar No. 14, $17,253.30. Noonday, bar No. 3, $4,070.50. Total of the district from 1st to 12th, $100,674.67.

A Rumored Consolidation.—It is rumored that the South Bulwer and Riqueza mines are shortly to be consolidated, upon what basis we have not learned.

NEVADA.

Mining Notes.—Grass Valley *Tribune*, June 14: The capital stock of the Excelsior Ditch and Mining Co., at Smartsville, has increased from $5,000,000 to $10,000,000. The Derbec mining company is now paying $2.50 per day, working 8-hour shifts. The old rates were $3 per day for 10-hour shifts. The North Bloomfield mining company have recently redeemed $50,000 of their 10% mortgage bonds. A fine specimen of copper ore has been exhibited in town this week by J. R. Nickerson, taken from a large ledge of his near Wolf creek, in the south end of Grass Valley township, near Bear river. Fine rock comes from the newly discovered quartz mine located about eight miles west of Wheatland, in the vicinity of Lone Tree hill. It is claimed that it is the richest quartz discovery ever made in that section. The tunnel of the Union gravel mine, situated near the head of Slate creek, has been run a distance of 710 ft. In the Centennial gravel mine, a large channel has recently been found which appears to be an overflow from the main lead.

PLACER.

Quartz Mining Items.—*Herald*, June 14: The Gould Bros. commenced hoisting the water out of the Booth mine last Monday. T. N. Goolsby and others are working what is called the Gold Leaf, also near Penryn. The rock they are taking out, we understand, prospects very well. R. Burns, of Michigan Bluff, and H. McCormick commenced work last Monday on the old Conrad mine, located on Duncan hill. They have started a new tunnel on the North Ravine side. This mine is owned entirely by Auburn parties. T. M. Tharp, on Duncan hill, has the water out and is again sinking. At present he is sinking in barren rock. The Eureka, located near the Eclipse mill, an extension of the Good Easter, is at present being worked by Hooper, Hillman and Bowen, and is turning out some very fine looking rock. The last crushing from this ledge paid about two ounces to the ton, and some 10 or 15 tons of ore now on the dump. Robinson and Fergurson have put up a whim and are reopening their old shaft on Posterior flat. Simons and Hurst are working an eastern extension of the Good Easter, on Posterior flat. They have the water all out and are ready to commence taking out ore. The Good Easter, owned by Holcom, Spring and Chesley, though only down a comparatively short distance, is paying remarkably well. The last crushing of about 24 tons yielded, we understand, nearly $3,000. It has already turned out considerable gold, and gets better by development. Shurtleff's mine, on Duncan hill, will yield, it is estimated, from $50 to $75 to the ton. The ore is of a dark blue cast, and in much of it gold can be seen with the naked eye Mrs. Kittler is working night and day shifts on her mine, located a little over a mile below Ophir, near the head of Georgia ravine. The prospects, we understand, are very flattering. Perkins, Fuller and White are working a ledge on Duncan hill, near Simons & Pelster's mill. It is reported that they have struck some good rock. Gooley and Myres are running a drain tunnel on what is known as the Bowlder lead, just north of Ophir. The shaft sunk on this lead showed some good prospects, though it was found difficult to work, on account of the water. The Crater has been running for some time on rock considered better than the average. They expect to clean up during the early part of next week. Edward and Arthur Tremillan, on their lead which they have been working some time, near the Bellevue house, are taking out some rich rock. Their last crushing, we learn, yielded them $49 to the ton. They have now on their dump some 15 tons of equally good ore. W. Pellow is working a ledge, also near the Bellevue house, and is reported to be taking out some very fine rock. The Julian, on Jenny Lind flat, is running steadily, with a full force of from 40 to 50 men. The large 24-stamp mill is kept pounding away day and night. In addition to these mentions, there is much prospecting going on, on a smaller scale. Altogether the activity in quartz matters in Auburn, Ophir and Newcastle districts was never greater than at present, and at no time in the history of the county, we believe, were the mines of these districts more uniformly paying for the labor expended in their development.

The Robertson Process.—The Robertson patent reduction works are now in operation at Ophir, and are sufficiently large to thoroughly test the merits of the process. At present they are operating on a pile of tailings from the Pugh quartz mill. The result, of course, of this first trial cannot be known until they clean-up. The necessary machinery is simple, and the process is by no means complicated. The ore is first roasted, then plunged into a chemical bath, then ground through the pans, and from the pans run into a settler. It is claimed to be cheaper than the chloride process, while it saves equally as much gold.

Law Suit.—The suit of the Dardanelles gravel mining company vs. the Mayflower gravel mining company, which has occupied the District Court for the past 11 days, has resulted in a drawn fight thus far, the jury having disagreed. They stood eight to three in favor of plaintiff, one man having been excused from serving, because of illness. The suit was instituted to recover damages caused by the defendant washing away a ditch belonging to plaintiff, and also to obtain a perpetual injunction restraining the former from further working that part of their claim where the alleged damage was wrought.

SIERRA.

The Downieville *Messenger* says there is great excitement in Sierra City and vicinity over the recent rich gravel discovery in the ridge southeast of that place. From a wheelbarrow load of gravel $8 were obtained. The whole country has been located, if reports be true. Many have great faith in the discovery, and believe that an immensely rich gravel deposit underlies the ridge for many miles. Some four or five new tunnels have been started, or are about to be started on the gravel range, recently discovered above Sierra City. Hart & Co., the discoverers of the lead, have run some 70 ft through fine rich blue gravel, and the end is not yet. This section gives promise of being a very hive of industry this summer.

TRINITY.

New Mill.—*Journal*, June 14: A new five-stamp mill for Davis Bros., of Bullychoop, arrived at Anderson last week. It will be put up and in operation at the mine by the middle of next week.

Struck it Rich.—The Dixon Bar mining company have lately struck a good body of very rich gravel—reported to be the best ever found on Trinity river.

TUOLUMNE.

Sonora.—*Democrat*, June 14: We understand the owners of the Live Oak mine are stoping out very fine ore. The sulphurets in this mine are of high grade, assaying some $500 per ton, about $75 of it silver.

NEVADA.

WASHOE DISTRICT.

Justice.—Gold Hill *News*, June 18: Connection is about being made between the winze from the 900 level and workings on the 1000 level. This winze is sunk in the ledge, and has followed a three-foot vein of rich ore which was discovered on the 800 level. The ore is worth from $150 to $200 a ton, two-thirds of the yield being gold.

Belcher.—The incline has reached 58 ft below the 2760 level. South drift is in quartz and porphyry assaying from $7 to $8.

Lady Bryan.—Both drifts are in low-grade quartz.

Niagara.—After a rest of about two years, work is resumed at this mine, and steam was started up this morning, the machinery working well. A full force of men are at work lining up and repairing the incline above the 500 level.

Sierra Nevada.—The water has been all raised from the incline, and Tuesday morning the work of sinking was resumed. The sump will be completed in two weeks, and then the stations at the 2300 and 2400 levels will be opened out, preparatory to opening up the levels themselves. No more trouble is anticipated from the water. The stopes continue their accustomed yield, and the dump is full of rich ore. The stopes are not being extended to the south, as many suppose. They are being carried on up from the present sill floors. The mine made its first shipment of $60,000 last evening.

Savage.—The drain is being carried and covered along the 1640 level toward the Sutro tunnel. Connection will be made the last of the week. The pumps and columns above the 1640 level have all been hoisted out, and the old air-boxes will be also out in a few days. The pumps below the 1640 level are in prime order. No change in the water of late.

Con. Imperial.—The north drift, on the 2600 level is being extended at the rate of from six to seven ft per day, and is now 350 ft from the south winze. This drift is following the trend of the vein which is northeasterly. The 2400 level drift, on account of its diagonal course, ran 610 ft between the lines, and accordingly this drift has some 250 ft yet to run to connect with the north winze.

Sierra Nevada, Mexican & Union Con. Shaft.—Sinking the shaft has been going on as usual during the past week. The material encountered is hard, blasting porphyry.

Gould & Curry.—The joint east drift, 1700 level, is again being pushed toward the perpendicular of the Osbiston shaft, and its face is now in porphyry and clay 950 ft from the lateral drift.

Con. Virginia.—The joint drift west, 850 level, is passing into a softer material showing some water, through which it is making rapid progress. Four ft per day are being added to the length of the south drift, 1500 level, running west of the old stopes, the face in vein matter showing streaks of quartz. The south drift, 2150 level, is making four ft per day through vein matter carrying streaks of quartz; total length, 175 ft.

California.—The joint west drift, 850 level, is in softer material carrying some water; total length, 240 ft. Sinking has not yet been resumed at the C. & C. shaft. A diamond drill is being sent down ahead to prospect for water. The 900 bob-station is completed, and a tank is being cut out at the 1050 station from which connection will be made with the general drain pipe leading to the Sutro tunnel.

Alta.—The east crosscut, 1350 level, is 28 ft in quartz containing spots of ore. The north drift, 1450 level is entirely in fine-looking quartz. The north drift, 1550 level, has entered Lady Washington ground, and is in promising quartz and clay. The north and south drifts, 1750 level, are each in 95 ft, and are bending around toward the vein, but have not yet reached the clay of the vein. Sinking for a lower level will be resumed next week. A tank for the 1750 level is being cut out. All work is making good progress.

Sutro Tunnel.—The work of retimbering the tunnel through the swelling ground, near the Savage, is making good progress. The work is being thoroughly and well done. The sub-drain will not be completed at the date required by the contracts, but Mr. Sutro explains what he means by "that will make no difference," by saying to the mining companies that the boxes at the Comstock end will be placed on the top of the bottom of the tunnel and ready for use July 1st. They will then be lowered to their place as opportunity offers.

Utah.—The main incline has attained a depth of 20 ft below the 1750 level, the bottom in good sinking ground. The lower tank station in the vertical shaft is being retimbered and the tank rebuilt.

Yellow Jacket.—Sinking has been suspended a short time to send a diamond drill down ahead to prospect for water, but was resumed this morning; depth of shaft at that time, 103 ft below the 2500 station. Work to connect the old explorations with the shaft, 2500 level, is making good progress.

Crown Point.—A drift has been started south to connect with that coming north on the 2700 level of the Belcher, and to serve as a base for future crosscuts. The north drift, 2500 level, is being pushed along the wall of the vein at the rate of from six to seven ft per day.

Homestead.—The work of excavating a side chamber, preparatory to sinking a winze on the ledge encountered in the tunnel, was commenced to-day.

Bullion.—Everything has been prepared and repaired, and once more the work of sinking the winze below the 2150 level is making good progress.

Trojan.—The northeast drift, third station, is being pushed in quartz, clay and porphyry, and is making good progress. The north drift from the upraise to the second level is passing through quartz giving fair assays.

Silver Hill.—Opening up the station at the 1300 level and preparing chutes, etc., for use on this level. On the surface, considerable changing and repairing is going on. The upper workings are yielding from 15 to 20 tons of ore per day.

Hale & Norcross.—Repairs to the eighth station have been completed. Everything is being looked to and put in readiness for use as soon as the Sutro tunnel is ready to take the water of the mines.

Best & Belcher.—The joint east drift, 1700 level, is in 950 ft, in porphyry and clay. The Osbiston shaft is making slow progress in sinking, on account of the heavy flow of water encountered.

PARADISE DISTRICT.

Eagle Mine.—*Silver State*, June 13: The Eagle mine, in Spring valley, has been sold to the Van De Water gold and silver mining company, of Nevada, a corporation composed of New York capitalists. The deed for the property was filed in the Recorder's office yesterday. The consideration is $2,000,000, part cash and part stock of the corporation.

Paradise Items.—B. F. Riley, who arrived in town from Paradise last evening, says it was reported that a very rich body of ore had been struck in the Big Prize mine last Thursday. He was shown a piece of the ore as large as a hen's egg, which was more than half silver. The Paradise company's mines, which embrace what were originally known as the Mountain Bride and Rough and Ready locations, have produced from ores shipped to Salt Lake and Rye Patch at least $200,000, and miners say that not one-half that amount has been expended in developing ores, of which there are now nearly 2,000 tons on the dumps. The same is true of the Big Prize, Bullion and other locations.

Live Yankee.—*Herald*, June 14: The owners are at present driving a tunnel on the line of the ledge and taking out about three tons of rock each shift, and are working two shifts per day. The rock contains a large amount of sulphurets and black galena, and shows some free gold. It is an excellent looking quality of rock, and will, without doubt, pay well. A crushing of 40 tons was made this week, but we have not learned the result. The ledge extends down nearly perpendicular and increases in thickness and richness of ore as they go down. At the place where ore is at present being taken out, it is nearly six ft thick. About 50 tons of rock are at present on the dump.

Ironclad.—*Transcript*, June 15: Within the past day or two a three-ft ledge of very rich quartz has been struck in one of the drifts of the Ironclad mine, below Rough and Ready.

Crosley & Olive Mine.—There is a heavy body of high-grade ore, and some of it under the incline assays as high as $800 per ton. This rock has many of the characteristics of the tellurium ores of the Bobtail and Gregory lodes in Colorado.

WILLOW CREEK DISTRICT.

Items.—Paradise *Reporter*, June 14: Our mining-expert reporter returned last week from a trip to Willow Creek mining district, and pronounces it one of the richest in the State. Leaving Paradise, the road to the mines bears to the northwest, and is an easy one to travel over until the summit (about 10 miles from here) of the Mount Rose range of mountains is reached, when it becomes necessary to dismount and lead your horse down and around very rocky cliffs. On the road we passed a number of magnificent fields of wheat and barley, and a quantity of bunch and other wild grasses sufficient to feed several thousand head of stock all summer. In fact, the country looks beautiful. There is also in the district a great deal of fuel—such as mountain mahogany, cedar and cottonwood trees—easy to get at. The prospects of the camp are bright, and the mines are all looking well. We found that the Ethan Allen drift has been run in on the ledge 21 ft, in good ore all the distance, and looking splendid in the face of the tunnel. The ledge is now 10 ft wide, and several assays just made, from an average of the ore, show returns of from $80 to $190 per ton. Drifting is being pushed vigorously ahead, day and night. The enterprising owners have built a wagon road to within 300 yards of the mine. They frequently encounter native silver and stefenite. There is an abundance of water, and at least 10,000 cords of wood can be procured within a distance of six miles.

ARIZONA.

Tombstone.—*Star*, June 12: The Tombstone mining company's mill, on the San Pedro, eight miles from the mine, is running on third-class ore from the Toughnut mine, and working through 15 tons per day, saving the metal by raw amalgamation up to 86% of the assay value, and giving bullion 068 fine. A roasting furnace is going up to work first and second-class ores, which are much richer in silver and gold, but need roasting. The first silver brick was turned out last week. It was about $2,000

Continued on page 404.

Public Libraries.

[Address delivered by A. S. Hallidie at the opening of the San Francisco Public Library, June 7th, 1879.]

The public school system of this country—a system worthy the respect of every citizen, and which, in spite of many imperfections, stands to-day the glory of this land and the admiration of enlightened nations—has grown up from the infancy of this nation parallel with it in character, coequal with it in strength and breadth, as deep seated as the roots of the tree of liberty, and expanding in glory and beauty as it sustains this nation's life, and gives vigor and vitality to all our institutions and national characteristics. From this grandest of all testimonials to the intelligence of the American people have emanated the public libraries of this country, so generally recognized as adjuncts to and essential sequences of the public schools, which educate the mind, in maturer years, to avail itself of the typical thoughts of men of the past and present, saved to us by the art preservative. As the apprentice is taught in the practice of his art to use the tools of his craft or the swimmer is taught to swim, so the scholar in the public school is taught the use of books. Destroy the tools and there is no need of the apprentice; remove the water, the swimmer's occupation is gone; abolish the public libraries, the usefulness of the public schools is impaired; by neglecting your harvest, what availeth the seed?

The libraries in the United States are the institutions of the people. From them they sprung and to them they belong; the rich need them not, nor the public schools. Bigotry abhors public libraries and hates public schools. But to the people—to nine-tenths of my fellow citizens they are each and both the guardian of their liberty, the guaranty of their independence. Knowledge is power—and a knowledge of power is independence. With apparent spontaneity libraries have developed in almost every hamlet and town where the public-school system exists. The exceptions are indeed rare; San Francisco being an example of this exception, the more astonishing from the recognized high educational standard of her public schools. Happily this cloud over her fair reputation is about to be removed.

Until quite recently the libraries of this country have been independent of each other in organization, management and experience. The Centennial celebration gave an impetus to every department of science and art, and the National Bureau of Education vitalized and gave form and homogeneity to the scattered and varied library interests of the country.

The conference of librarians held in Philadelphia in 1876, first fairly brought before the world the main features of the work being done by them and produced that valuable and now scarce report on the Public Libraries of the United States by the Bureau of Education. The result of this conference was so well appreciated abroad that a similar one was held in England in the city of London the year following, when a large number of delegates were present from the United States. This convention, in acknowledgement of the earnestness of the work done in this country, adopted the *Library Journal* published in Boston, Massachusetts, as the official organ of the libraries of Great Britain. That the subject has become of extreme importance and public interest may be gathered from the fact that last year a further conference was held in Oxford, England, and that during the present month (June) a conference will be held in the city of Boston, Mass. The results of the conferences will be a more thorough understanding of the mission and scope of public libraries, a greater compatability in their management, an exchange of good offices, the elimination of much valueless material that hampers the shelves, and the grading of the libraries.

My recent visit to the principal libraries of the United States has increased my respect for them and my appreciation of the great work they are doing. Few persons can have any conception of the careful thought, untiring energy and disinterested efforts of the many self-sacrificing men and women of this country who are, and have been devoting themselves to the cause of education and better morals by means of the public libraries.

I propose very briefly to refer to three of the libraries I visited and which I think may be taken as representatives of separate classes—the public library of Worcester, Apprentices' library of New York, and the public library of Boston—the first meeting the wants of a thriving manufacturing district, the second supplying the needs of young men and women actively employed in some trade, the third to supply the general public of a city of more than average intelligence.

In 1859, Dr. John Green gave to the city of Worcester a library of 7,000 volumes for reference and consultation, and to be used only in the building. Immediately thereafter, the Worcester Lyceum and Library Association presented its library of 4,500 volumes as a nucleus for a library of circulation, both of which the city accepted, and thus established the Free Public Library of the city of Worcester. In 1865, the citizens raised a fund of $11,000 to maintain a reading-room, and in the same year the library received a legacy from Dr. Green of $30,000, as a permanent fund, one-fourth of the interest of which was to be added to the principal. The library now consists of 46,000 volumes, of which about 26,000 are for reference, and 20,000 for circulation. During the past year 132,384 volumes were taken home and read, and 30,079 were read in the reference room. There are 15,547 names of persons entitled to use the library on the register. The library is open every day, including Sunday, for reading, from 2 to 9 P. M., and the average Sunday attendance is 248. The library is in a good substantial stone building, and is well supplied with general literature, but is especially rich in illustrated works on the arts and industries; and there is not a mechanic or artisan in Worcester but can find there abundance of authorities and information on his trade or calling.

Worcester has a population of about 50,000. It is quite a manufacturing center, and as busy a town in proportion to its population as any in Massachusetts; and it is to be congratulated upon the excellent care and judgment that have been exercised in the selection of books so well adapted to the needs of the community. Here we have a town with a population of 50,000 souls, with an exceedingly valuable public library of 46,000 volumes, or nearly one volume to every man, woman and child living there.

The Apprentices' library, in New York, although occupying a building not constructed or particularly well adapted for the purpose, is perhaps the best arranged library of its size and for its opportunity, of any I have visited. The impression on entering was exceedingly agreeable and striking. The library room proper is 104 feet long by 36 feet wide. The light comes from the roof, through a skylight 75 feet long by 16 feet wide, and the bookcases are arranged in alcoves surrounding the room on two sides and one end three tiers high, eight feet deep; each bookcase is eight feet high and has a space of three feet between. In this room also are the waiting room, delivery desk, librarian's desk, etc.; and the shelving, containing 60,000 volumes, has room for 40,000 volumes more. The light is ample, the books easy of access, and opportunity for classification is admirable. The library is quite an old one, as the General Society of Mechanics and Tradesmen, of the city of New York, was chartered in 1792. The library is owned by this society, but it is a free library, and open to all young men and young women who are actually engaged in active employment. It circulates 128,000 volumes annually, and the evening I was there the reading rooms were well filled; and there were at one time about 50 boys and as many girls selecting books on the catalogue and awaiting the delivery. The utmost order and decorum prevailed. It was a great pleasure to see the good work this library was doing among these young toilers and workers, and the interest they took in the library.

The Boston public library was started in 1852, through a gift from Mr. Joshua Bates, of $50,000 to the city. A site was selected and a building erected at a cost of $365,000, and was opened to the public in 1858. Its growth has been remarkable, and it stands to-day at the head of the libraries in the United States as much in the number of its books, liberality of administration, extent of active work and thoroughness of organization.

In order to make the work of the library as useful and general as possible, there are eight branches located in different parts of the city, which enable citizens to obtain books without too great a distance to travel. The number of books in the library at this time exceeds 350,000 volumes, and there were issued during the year 1,183,991 volumes, which were taken home and read. Ten years previous (1868) the circulation was but 75,570. The number of persons registered who have applied for the use of the library since 1852, is 128,141, of which 75% may be considered active. The population of Boston is about 400,000, thus giving, as in the case of Worcester, nearly one volume to each man, woman and child in the city.

Of course, such a library requires a large force to carry it on, and there are about 130 persons engaged, the amount of salary being about $65,000 annually, and the amount invested in books for the past five years being $150,000. As high as 10,478 books have been withdrawn in one day from the central library and its branches, and the loss from all causes does not exceed one in 10,000.

The influence of the Boston public library has been and is most marked, which is largely due to the appreciation of its great value by the citizens, and the earnestness and intelligence exercised by its late librarian, Mr. Justin Winsor, (now at Harvard).

It is no use tiring your patience with any reference to other libraries I visited. Suffice it to say, that at St. Louis, Indianapolis, Cincinnati, Baltimore, Philadelphia, New York, Boston, Brooklyn, Pittsburg, Cleveland and Chicago I found well-established, free public libraries, all active and growing; and there remains the city of San Francisco, with its population of about 300,000 souls, with its feeble attempt at a public library, disputing over the miserable appropriation of $24,000.

In the year 1800, there were, all told, 80,000 volumes in the various public libraries in the United States. Seventy-six years later, there were 2,958 public libraries, possessing 12,039,724 volumes. In 1860, there were 27,730 public and private libraries, with 13,316,000 volumes; and 10 years later there were reported 164,815 public and private libraries, with 45,629,000 volumes.

Joshua Bates gave Boston $50,000 to start its public library, and added $50,000 more before he died. Peter Cooper gave the Cooper Institute 17,500 volumes to establish its library, and this was but a fraction of his princely benevolence in similar directions. George Peabody gave Baltimore $1,400,000 to establish a library there. John Jacob and William B. Astor gave New York $700,000 to found and maintain the Astor library. John Lenox gave $700,000 to found the Lenox library in New York, and is still adding. Walter N. Newberry has left $2,000,000 to Chicago to establish a library on the north side. Joseph Fisher left Philadelphia $55,000, and Dr. James Rush left the same city $1,000,000 to maintain a library there. Mr. Howes has just left the Boston Athenæum $150,000 towards its library, and Mr. Asa Packer has given $500,000 to the library of the Lehigh University, and these are but a few of the gifts that have been made to the libraries of this country.

I cannot but feel humiliated that San Francisco should have so long stood alone not only without a great public library, but without any of those public galleries and halls which tend so much to make a community better in thought and action.

The public libraries of America have a unique existence and a patriotic object. They are not gathered together by the vanity of national pride or wealth, and are thus different to the great libraries of bygone ages, but they are built up by the necessities of conditions peculiar to the American people; they are the guide, the friend, the solace of the workingman and toiling woman—the instructor, the hope and the rest. The public schools make them a necessity, and to impede their success, their progress, or their usefulness by ever so little an obstacle is a crime before God and man.

Let us then earnestly unite in destroying the difficulties in the way, and with those difficulties sweep away those who through ignorance or viciousness would retard the onward progress of the Public Library of San Francisco.

The Telluride Ores of Gold.—No. 2.

[Thesis by Russell L. Dunn, College of Mines, University of California.]

Mineralogy.

The mineralogy of the tellurium minerals is extremely interesting, since tellurium is the only non-metallic element with which gold occurs in chemical combination in nature. These minerals are never found very far from gold. The native tellurets invariably contain at least a trace of gold. So intimate is this relation that we may consider all of the tellurium minerals in connection with its gold combinations, and although only two or three of the latter are abundant enough to constitute ores, their discussion, without reference to the others, would be incomplete. Some of these species are extremely rare and have only recently been discovered, most of them in Colorado. Several mineralogists have been investigating these minerals, and the results obtained by them are of considerable value and interest. I shall first take up a few of the most interesting of these minerals in detail, giving such results of investigations already made as may be peculiar or practically useful, without stating all the technical details. These latter can readily be obtained from standard mineralogical works or the references cited.

Sylvanite or graphic tellurium is the principal telluride ore of gold. It has been extensively mined for that metal in Transylvania, where it was first discovered. In both California and Colorado it is found; in the latter it is quite important, metallurgically considered. *The chemical composition of the Colorado mineral seems to differ somewhat from that of Transylvania, but not enough to be considered a distinct species. The following will show the relative proportions of gold and silver in each variety:

Colorado (Silliman)	Au 1.7	Ag 1.0
Transylvania (Berzelius)	Au 1.8	Ag 1.0

Calaverite was first found accompanying other telluride minerals in ore from the Melones mine, Calaveras county, California, by Dr. Genth. It is the most valuable of the telluride minerals, as it contains the highest percentage of gold. It occurs massive and without any indications of crystallization; color, bronze yellow; streak, yellowish gray; brittle; fracture, uneven. From 3.06% to 3.52% of silver is present. An analysis made of the mineral from Colorado gave the composition as follows:

Au	39.01
Ag	3.09
Te	57.99
	100.00

This composition corresponding to the formula ($\frac{2}{3}$Au $\frac{1}{3}$Ag) Te$_2$. Dr. Genth considers the yellow variety of *Sylvanite* found in Transylvania to be nothing but impure *Calaverite*.

Coloradoite was discovered in Colorado associated with other tellurium minerals. It has, as yet, been found nowhere else. It occurs massive, somewhat granular; color, black, inclining to iron-gray; luster, metallic; hardness, about 3; fracture, uneven to euh-conchoidal; sp. gr. is 8.627. Before the blow-pipe, in a closed tube, it yields mercury, tellurious acid and tellurinm. A specimen from the Keystone mine, Boulder county, Colorado, showed, on analysis, the following composition:

Te	42.05
Hg	52.23
Cu O	0.48
V2 O3	0.70
Fe	2.44
Mg O	.11
	99.32

Dr. Genth, who made the above analysis, considers its formula to be Hg Te, corresponding to Hg Se and Hg S. I am informed that native mercury has been found accompanying this mineral. It, of course, results from the decomposition of the telluride.

Altaite is found in considerable quantities (comparatively) in both California and Colorado in their respective telluride districts. Its formula is Pb Te, a small portion of silver almost invariably replacing some of the lead.

Henryite was discovered and named by Prof. Endlich, who found it in Red Cloud ore from Colorado. It seems to be exceedingly rare. In its physical properties it resembles *Altaite*, but differs from it in chemical composition. An analysis gave the following result:

Pb	59.19
Fe	5.05
Ag	0.31
Te (by difference)	41.45
	100.00

This agrees very nearly with the formula 3Pb Te+Fe Te, with a little of the lead replaced by silver. Pyrite invariably occurs with it, but there is not the slightest trace of sulphur in the pure mineral.

Hessite Group.

There are a number of tellurium minerals very much resembling each other in appearance and physical properties, but differing slightly in chemical composition. They can all be considered as hessite in which gold is present, replacing the silver from a trace upward. I have accordingly, for want of a better name, called them the Hessite group.

Table Showing Composition and Gold and Silver Ratios of the Hessite Telluride Group.

LOCALITY.	NAME.	FORMULA.	COMPOSITION. Au.	Ag.	Te.	Others.	Ratio of Au to Ag
Siberia	Hessite.	Ag Te.	trace	62.8	37.2		
Colorado	Au. Hessite.	.....	7.13	51.06	.....	.....	1
Calaveras	Petzite.	Ag$_3$ Te+Au Te.	25.3	41.0	33.7	.....	1
California	Petzite.	Ag$_3$ Te+Au Te.	25.3	41.8	32.7	.....	1
Colorado	Schirmerite.	Ag$_3$ Te+(Au Pe) Te.	18.3	25.0	.....	Fe, Pb.	1
			.....	.....	.....	.....	7.1
			.....	.....	.....	.....	2.44
			.....	.....	.....	.....	1.65
			.....	.....	.....	.....	1.5

Of †auriferous hessite, Prof. Silliman, who has investigated it, does not give a complete analysis. Of ‡Schirmerite, discovered and named by Prof. Endlich, the formula ie only given as probable. He gives the result of an incomplete analysis. Petzite is the principal gold-bearing telluride in the California veins and occurs in nearly all of the mines where tellurides are found in Colorado. Besides the mineral species already noticed, tellurium and gold are found associated in several rare minerals, generally accompanying some of the former, but they are of no importance as a source of gold and will not therefore be considered.

The greater amount of all these gold-bearing tellurides is disseminated throughout the mass of silicious ganguc. In pockets, bunches and seams of pure mineral are sometimes found, but rarely of any great size. Sylvanite and petzite sometimes occur foliated, and the latter would seem to be composed in many cases of thin flat scales, so fine as to float in water. Sylvanite has the lowest specific gravity, about 5.7, and from this up to 8.28; the average of the others is about this latter figure. All are quite soft, ranging in hardness from 1.5 to 3.5.

Associated Minerals.

The associated mineral species are, with few exceptions, not characteristic. Among the exceptions may be noted the rare vanadium mineral, Roscoelite. It was first discovered in one of the telluride veins in California and has since been found in Colorado. A Colorado mineral considered by Dr. Genth, who has examined it, to be a variety of Roscoelite, with the vanadium nearly all replaced by aluminium, is common enough to be sought after as an indication of the presence of tellurides. It occurs as a green stain in the quartz. It is itself perfectly barren of gold and silver, but is often associated with the telluretted minerals of these metals. The California mineral is said by Dr. Blake to be microscopically interlaminated with gold.

A knowledge of the character and amount of the minerals present in an ore as impurities is indispensable to the metallurgist. In the ores of gold and silver the amount of these impurities is usually far greater than that of the valuable mineral, and, as a rule, on them, and not on the condition of the gold and silver, does the choice of the whole or part of the process employed depend. Though this is hardly the case with the telluride ores, the principal difficulty

*"American Journal of Science," 1874, Vol. VIII., No. 43, p. 25.

†"Proceedings Am. Phil. Soc. of Philadelphia," Vol. XIV., p. 230.

‡*American Journal of Science*, Vol. VIII., No. 43, p. 25.

§"U. S. Survey of Colorado," Hayden, 1876, p. 354.

with them being to get rid of the tellurium without losing gold at the same time, still they have more or less influence in determining the line of treatment.

For the purpose of comparison I give a list of associated minerals, as found in two or three of the localities where these ores are mined:

1st. Stanislaus mine, near Robinson's Ferry, Calaveras county, California. The gangue is quartz. Mineral species are dolomite, calcite, siderite, pyrite, chalsopyrite, a titaniferous iron, mispickel, and in small quantities, galena, sphalerite and roscoelite.

2d. Red Cloud mine, Boulder county, Colorado. Gangue, an impure quartz containing crystals of feldspar. Mineral species are pyrite (abundant), galenite and sphalerite in small quantities; no silver or copper compounds with sulphur, are found. [Endlich.] The same will answer for the other tellurido mines of Boulder county, except that arsenical and copper pyrites are found in some of them.

As shown by the preceding there is a great paucity of mineral species—excepting tellurium compounds—in these veins, and in fact in all of both California and Colorado deposits of workable tellurides the same peculiarity is observable. This paucity is still more marked in comparing them with the deposits in Transylvania. In the veins of Nagyag, over 40 distinct mineral species are found.

The following is a list of the tellurium minerals thus far found in the United States. The localities are also given. All are more or less rich in gold and silver:

1. *Altaite.*—Melones and Stanislaus mines, Calaveras county, and the Golden Rule and Green mines, Tuolumne county, Cal. In nearly all of the telluride mines of Boulder county, at the head of Blue river and near Lake city, San Juan county, Col.

2. *Calaverite.*—Stanislaus and Golden Rule mines, Cal. Several mines in Boulder county, Col.

3. *Coloradoite* [Hg Te].—Boulder county, Col.

4. *Henryite.*—Red Cloud mine, Boulder county, Col. It will probably be found in other mines in the same vicinity.

5. *Hessite.*—Near Georgetown, El Dorado county, Cal. (float). It probably occurs mixed with other telluride minerals in both California and Colorado.

6. *Auriferous Hessite.*—Red Cloud, American and other mines in Boulder county, Col.

7. *Lionite.*—Mountain Lion mine, Boulder county, Col. (Gentb).

8. *Melonite* [Ni_2 Te_3] (?).—Stanislaus mine, Cal. (Genth).

9. *Montanite.*—A telluride of bismuth, Highland, Montana Ter., (float). (Gentb).

10. *Nagyagite.*—Several mines in Boulder county, Col.

11. *Petzite* [3AgTe + AuTe].—Calaveras and Tuolumne counties, Cal. Boulder county, Col.

12. *Schirmerite.*—Red Cloud mine, Col.

13. *Sylvanite.*—Stanislaus mine, Cal. Boulder county mines, near Lake City, San Juan county, near Parrot City, Col.

14. *Tellurite* [TeO_2]. Smuggler and John Jay mines, Boulder county, Col. (Gentb).

15. *Tellurium.*—Calaveras and Tuolumne counties, Cal. Boulder county, Col.

16. *Tellur-pyrites.*—Boulder county, Col. (Sbepard).

17. *Tetradymite.*—Several localities in the gold region of Virginia, North Carolina and Georgia, Boulder county, Col.

In addition to the localities already mentioned, tellurides have been found or reported to have been found in several other places. In Boise Basin, Idaho Ter., workable deposits of the gold-bearing tellurides (probably similar to those of Colorado) have been found. At several points in a line from Boulder county to Lake City, San Juan county, in Colorado, unimportant discoveries have been made. In the northern part of Kern county, California, tellurium minerals are reported to have been found in the Harley mine, seven miles from Kernville, and near Bahton. Some years ago a telluret was found in quartz from Grass Valley, Nevada county, also in the Tellurium mine, Amador county. Finds have been reported during the last few weeks in San Luis Obispo and Sierra counties. These minerals have a much wider distribution than was thought a few years ago, and it is reasonable to suppose that as some of the new gold quartz districts of Colorado, Idaho and Montana become explored and developed, new discoveries of value will be made.

[To be Continued.]

RAPID COMMUNICATION.—A merchant, sitting in his office in South-street, New York, recently received an answer to his dispatch sent to Shanghai, six hours previously. Thirty thousand miles in six hours is good time even for the telegraph. The charge to Shanghai is $2.80 per word; to Yokohama, $3.05; but the code, or cipher, is so well systematized by certain mercantile houses, that a single word serves for a dozen when transcribed.

KEEPING PACE WITH THE ADVANCE OF SCIENCE.—It is an interesting fact that the progress of scientific knowledge is so rapid that the great cyclopædias and dictionaries, instead of being always infallible authorities, are compelled to make frequent amendments. Being stereotyped, they are compelled to melt up their whole stock every few years, and reprint the whole or soon become unreliable and antiquated.

USEFUL INFORMATION.

Spontaneous Combustion Practically Considered.

Although of paramount importance to machine shops and all industries requiring the use of swift running gear, oil, packing, rags, etc., spontaneous combustion seems to have assumed the mixed phase of spontaneous generation. In both cases the cause is disregarded, and the effect mostly considered. It is a fact, however, that machine shops, mills, etc., are destroyed by the spontaneous ignition of certain elements, the origin and nature of which are as perfectly known to science, as any can be. In the case of oiled rags, we know that heat is gradually developed by the absorption of the oxygen of the atmosphere, until the hydro-carbon of the oil ignites spontaneously. It is the nature of these elements to do so, and we need not be more astonished that such ignition should occur, than if we were to apply a lighted match to gunpowder, and an explosion follow.

In the case of a boiler covering or packing, the same elements concur to produce the same result, viz., the heat of the boiler gradually carbonizes the covering or packing, and the hydrogen of the atmosphere uniting with it, is operated upon finally by the oxygen until ignition takes place.

The same may be said of wood work exposed to continual or repeated heat, as the flooring under and surrounding a furnace or stove, or near a stove-pipe. Here, although the metal is not in contact with the wood, yet the heat of the metal carbonizes the atoms floating near it in the atmosphere, which falling or settling upon the wood work accumulate to such a degree, and permeate the pores of the wood so completely, that the atmosphere operating upon it finally causes ignition, which consumes the wood.

In machine shops, particularly in mills where the machinery is run at a high rate of speed, the friction generated by the motion carbonizes the atoms which are always floating in the atmosphere, and which penetrating everywhere, even into the pores of dry exposed wood, or other porous combustible material, bring about ignition silently but as surely as a direct application of fire.

Of course an explosion often occurs, but this is simply the rapid ignition peculiar to all hydrocarbons.

It is useless to deride these facts, cases of spontaneous combustion are increasing in frequency, principally in old establishments where the carbonizing process has been going on for years, or in those more recent ones in which nature is aided by the carelessness of man, and her otherwise slow but sure processes accelerated.

Perhaps a remedy would be a thorough renovation, and the use of plenty of incombustible paint on all surfaces exposed to favorable influences. Of course old and dry wood, saturated with carbon, could be prevented from any further chemical action, while new wood would have its pores filled up by the use of such paint to the exclusion of deleterious atoms.

Many of our hydro-carbons will not stand a fire test of 60°, and even those in common use do not rise above 110°; so that the heated atmosphere of our shops and mills, often much greater than this, will operate as too high a fire test.

Precaution is much less expensive than the expenses of litigation to recover insurance, more especially since courts, led astray by professional experts, hold that the damage is caused by the explosion and not by fire—placing effect again before cause. Shooting off the gun without igniting the powder.

TO PREVENT MOLD IN CELLARS, ETC.—To prevent the formation of mold in malt cellars and fermenting cellars, it is not sufficient to paint the walls, floors and ceiling with ordinary milk of lime or whitewash, but it is well to add some carbolate of lime. It would also be worthy of a trial to paint the outsides of fermenting vats with water-glass, to which some salycilic acid has been added. The vats would probably gain in durability as well as density. Phenol is frequently preferred to salicylic acid as an antiseptic. That this preference is not quite justifiable was shown by the experiment that 25 milligrammes phenol interrupted the germination of 100 grains of barley; but on the evaporation of the phenol, the grain regained its germinating power. A mixture of 50 milligrammes salicylic acid, with 50 cubic centimeters water, destroyed the germinating power of the same completely.

INCOMBUSTIBLE PAINT.—In connection with the query as to how combustible surfaces are to be protected from fire, spontaneous or otherwise, we call attention to the fact that water-glass, or soluble silicate of soda, will, in most cases, be a protection against fire, and may be mixed with any paint. Beams, lath, hoards, etc., painted with colors containing water-glass, are found to be unaffected by fire. The proportions are as follows, viz.: 25 parts by weight of pulverized haryta spar, which is mixed dry with one part of zinc white and made into a pulp with 20 parts of water; then add 25 parts of water-glass, or silicate of soda. When using this paint, it must be stirred frequently. Three coats are generally enough.

A NEW DISINFECTANT.—Dr. John Day, of Geelong, Australia, recommends for use in civil and military hospitals, and also for the purpose of destroying the poison germs of small-pox, scarlet fever, and other infectious diseases, a disinfectant ingeniously composed of one part of rectified oil of turpentine and seven parts of benzine, with the addition of five drops of oil of verbena to each ounce. Its purifying and disinfecting properties are due to the power which is possessed by each of the ingredients, of absorbing atmospheric oxygen, and converting it into peroxide of hydrogen—a highly active oxidizing agent, and very similar in its nature to ozone. Articles of clothing, furniture, wall paper, carpeting, books, newspapers, letters, etc., may be perfectly saturated with it without receiving the slightest injury; and when it has been once freely applied to any rough or porous surface, its action will be persistent for an almost indefinite period. This may, at any time, be readily shown by pouring a few drops of a solution of iodide of potassium over the material which has been disinfected, when the peroxide of hydrogen which is being continually generated within it will quickly liberate the iodine from its combination with the potassium, and give rise to dark brown stains.—*British Medical Journal.*

MENDING BROKEN CASTINGS.—An ingenious method of mending broken castings is thus described: To insure its success, it is necessary that the parts to be reunited should be broken entirely across, so that the two parts shall be independent. It consists in heating the two pieces together by a stream of molten cast-iron until the surfaces of the fracture and the parts immediately adjacent to it commence to melt. Exactly at this point, the flow of cast-iron should be stopped, when the softened surfaces left behind will unite in chilling, and if the operation has been properly conducted, the new seam will be quite as strong as any other part of the piece. It is obvious, in addition to the precaution above named, that the melting should extend over the whole of the fractured surfaces, and that to prevent the actual running down of the pieces, the thickness of the casting must not be too small.—*National Car Builder.*

BEAUTIFUL BLACK COLOR FOR BRONZE.—A strong concentrated thin solution of nitrate of silver is required for this purpose. It should be mixed with an equal solution of nitrate of copper, and well shaken together. The pieces which require coloring are dipped into this solution and left for a short time. When taken out, they should be equally heated till the required black color makes its appearance.—*Scientific American.*

TO PRESERVE ICE.—To preserve small quantities of ice, it is recommended to tie a piece of coarse flannel on a suitably large vessel in such manner that the cloth forms a sack reaching down inside the vessel about halfway to the bottom. In this sack the pieces of ice are placed and well covered with flannel. It is good also to provide a constant exit for the water from the bottom of the vessl.

GOOD HEALTH.

Good Health.

The true significance of "good health" is comparatively unknown, or at least unappreciated to any but an invalid. To the latter it is a Utopian dream, much longed for and sighed for. "I would give all I am worth for health," says the unfortunate; but, alas! when well, "two bits" would be regarded as a high consideration. The fact is, we eat too much; if not too much, we eat in the wrong direction. We drink, smoke, work too much without regard to the strain upon our nervous organization. Neither physical or mental labor shortens life, on the contrary adds to life by working off the dead matter constantly cast aside in the laboratory of the system. But the food supply must be adequate and enough. Two men brought upon the tapis of business, attempt to play the game of the racing rival steamers on the Mississippi, "win the race, or burst," forgetting that either to win, or to burst, the supply of fuel must be proportionate to the amount of steam required. If we would drug less and eat more judiciously selected food, we would see less dyspepsia and other horrors. Everybody has an ailing, and everybody tries all the known and some unknown remedies to tone up with. The result is the stomach made to digest assimilating food, shrinks from the drug-store equipments lodged into it by its merciless owner, and gives up the ghost. Look at the drug stores on every corner, read the quack nostrums and specifics advertised everywhere, and imagine the feelings of a good-natured dyspeptic apparatus at the sight of its ultimate fate. Brillat Savarin lays down the rule, that properly cooked food in sufficient quantities; nay, large quantities, will drive away dyspepsia. The men who accomplish the greatest amount of physical or mental labor are the greatest eaters, they have to be, or nature would sink. We feed a horse in proportion to the work he has to do, but starve our own poor stomachs, and feel surprised that nature will not respond to our efforts. We say life is short and uncertain. Why, no! it is not necessarily so. If we contemplate suicide, of course we can tell to a minute, but otherwise we have the means of living and certainty of life within our grasp—in the observance of common sense rules as regards our food and its proper preparations. A man can be a genius on a diet of pork and beans, provided they agree with him, and that is just what we must all study: Learn what things agree with our stomachs, what climate best agrees with our lungs, what clothing best suits our comfort. Let everything else go, and work and eat to your heart's content, leaving death to Him who gave you life.

Milk and Lime Water in Nervous Disorders.

In a paper on "Milk with Lime Water as Food and Medicine in Nervous Disorders," presented by E. N. Chapman to the Medical Society of the State of New York, at its recent annual meeting, the author deprecates the warfare of drugs against disease which is now being waged by specialists more vigorously and systematically than ever before. Digestion and assimilation, he asserts, are ignored, and the attention is absorbed by one or more prominent symptoms in a part remote from the primary source of morbid action. Consequently the efforts of the physician to cure his patient are too often unavailing.

He states that having used, the last few years, milk with lime water almost exclusively as the diet of his patients, he has attained a success unknown to him when he depended more on medicine and less on food. To illustrate the ready assimilation, the nutritive quality and the remedial power of milk, when rendered digestible by lime, he presented notes of a number of cases treated by him, embracing a class involving the nerve centers, and that are acknowledged to be little under the command of accepted modes of treatment; such, for instance, as marasmus, anæmia, paralysis, indigestion, neuralgia, chorea, dementia, and alcoholism.

In concluding his paper, Dr. Chapman remarks that the efficacy of milk with lime water in the illustrative cases brought forward by him is equally observable in others whenever, either primarily or secondarily, the nutritive functions are much at fault. The milk (with a pinch of salt) being rendered very acceptable to the stomach by the lime, may almost always with advantage be made the prime article of diet in the sick room, however diverse the conditions. It is the most digestible and at the same time the most nourishing food that can be given. It allays gastric and intestinal irritability, offers a duly prepared chyle to the absorbents, supplies the blood with all the elements of nutrition, institutes healthful tissue changes, stimulates the secreting and excreting glands, and, in a word, provides nature with the material required to sustain herself in her contest with disease. If it be conceded that nature always accomplishes the cure whenever it is secured, and that drugs merely aid, direct, or modify her efforts to this end, it will be self-evident that the food which supplies the vital forces with all the power of resistance they possess is a matter of the first importance, and that milk acted upon by lime, provided it contains all the essential properties of other articles epitomized, and is more friendly than any or all of them, has a range of application almost as extensive as the disease itself, whatever its character and whoever the patient.

The Flesh of Diseased Cattle as Food.

Dr. E. Decroix, ex-Veterinary Surgeon-in-Chief of the French army, writes to the editor of the *Lancet*, *apropos* of the plague which is affecting the cattle of the English army in Afghanistan, as follows:

"Allow me to assert," he says, "that the flesh of animals affected with the 'cattle plague' may be eaten without fear and without endangering the health. In support of this assertion, I rely on a large number of observations that I have been collecting together for a long time, and especially on experiments that I have made myself. At Paris, from the 23d of February to the 8th of March, 1871, after the siege, the cattle plague existed among the oxen and cows collected at the abattoir of Villete as food for the public. Many of these animals, affected with the disease, were slaughtered for the meat market, yet no accident happened to the consumers. For my own part, I went to the slaughter-house during 15 or 20 days for the flesh of the animals that had died of the plague. I ate this boiled, stewed, roasted and in the form of soup, etc., during all that time without feeling the least illness from it. Moreover, I several times invited friends, especially veterinarians, who ate this meat with impunity. Desiring to carry my experiments still further, I ate the flesh raw, in order to remove the fears of those persons who might have been alarmed in learning that certain butchered animals had been afflicted with the plague. The soldiers of the army in Afghanistan may eat, then, the flesh of animals affected with this disease. There is no danger even in eating meat of animals that have died, but, for certain reasons, it is preferable to order the cattle slaughtered at the first symptoms of the disease. In the Crimea we allowed ourselves to go hungry, while many horses and sick beeves were lost. With more experience at the present time, I urge our brothers in arms of England to make use of the cattle affected with the disease under consideration; they will suffer no ill effects from it."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Eaton's Improved Spoke Tenon Auger; Specific Gravity of Minerals; New Gravel Mining Pump, 393. The Week; The Weather Bureau on the Pacific Coast.—No. 2; The Many Forms of California Mining, 400. Ancient Mine in Mexico; Notes on Geysers, 401. International Meteorological Congress; Electricity in Harness; New Double-Acting Deep Well Pump, 404.

ILLUSTRATIONS.—Eaton's Spoke Tenon Auger; Apparatus for Determining Specific Gravity of Ores, 393. Geysers of the Yellowstone Park, 401.

CORRESPONDENCE.—Beet Sugar in California; The Mineral King Mines of Tulare County, 394.

MECHANICAL PROGRESS.—A Rapid Voyage; Steel Wire Belts; Bending Timber; America's Fifteen Inventions; New Buoys; New Railroad Tie; Delicacy of the Mint Scales; Tide-Water Pipe Line; The Microphone in Mine Disasters; Pneumatic Tubes, 395.

SCIENTIFIC PROGRESS.—Scientific Incredulity; Science as a Detective; Another New Metal; Hemacite; Chloride of Magnesia in Gas Meters; Vanilla from Oats, 395.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards. Notices of Assessments, Meetings and Dividends, 396-97.

USEFUL INFORMATION.—Spontaneous Combustion Practically Considered; To Prevent Mold in Cellars, Etc; Incombustible Paint; A New Disinfectant; Mending Broken Castings; Beautiful Black Color for Bronze; To Preserve Ice, 399.

GOOD HEALTH.—Good Health; Milk and Lime Water in Nervous Disorders; The Flesh of Diseased Cattle as Food, 399.

MISCELLANEOUS.—Public Libraries; The Telluride Ores of Gold.—No. 2, 308-9.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico and Utah, 397-404.

NEWS IN BRIEF on page 404 and other pages.

Business Announcements.

Mining Supplies, J. L. Hull, S. F.
Assessment Notice—Numa Mining Company.
Caution to Section Chimney Builders, J. Browell, S. F.
Pioneer Plating Works, John Morrison, Proprietor, S. F.

The Week.

Accounts from every quarter show that the state of trade throughout the country is in a prosperous condition. This is shown particularly by Clearing House returns. Only New Haven and New Orleans show a decrease. Otherwise Eastern cities and San Francisco show considerable gain, and over the corresponding week of last year a gain of nearly 16%. Our mines certainly are not giving out. All industries must become stationary at certain periods of the year. At the present time the mining interests on this coast are awaiting in certain localities the solution of the problem attempted hy the Sutro tunnel, while other interests are repairing, replenishing or making preparations, so to speak, to take a fresh hold. Eastern capital continues to flow in upon our mining interests, and once having commenced, it will he difficult to stop or withdraw it. Heavy investments in Bodie stocks by prominent New York capitalists indicate a condition of the mining share atmosphere better than anything else. These capitalists are wise and not apt to act foolishly. So we must believe that our future will he prosperous. We must not forget, however, that capital is sensitive, and so let truthful accounts he returned of our interests. It will not do to overrate our condition, for then we would he working against future assured interests for the sake of a small temporary gain.

ENORMOUS ENGINEERING UNDERTAKING IN FRANCE.—The new French Minister of Public Works, M. de Freycinct, proposes a series of engineering works which effectually puts into the shade anything ever attempted on this continent. Even the Isthmus canal pales before this new project. So far as the amount of capital is involved, M. de Freycinct proposes to expend about $800,000,000 on a vast network of State railways and hydraulic works. His plans, which have almost all been sanctioned, comprise the maintenance of about 23,500 miles of national railways, not much more than half of which are at present in working order, and 5,000 miles of which have yet to he built, and the expenditure of $150,000,000 on new canals and old systems, and about $50,000,000 on the improvement and deepening of ports and harbors.

The Weather Bureau on the Pacific Coast.—No. 2.

In a preceding article we remarked briefly on the operations of the Signal Bureau in connection with the visit of Robert Craig, made not long since to this side of the Continent. This subject of coast meteorology was in that article partially gone over, covering the directions of the winds, movements of storm centers as belonging to helts of the globe, etc. It may here he remarked that the scientific generalization made for the first time in the meteorological history of the country, wherehy the trade-winds were connected with the revolution of the earth upon its axis, and all other winde were ehown to be hut modified effects from the same cause, was the beginning of practical weather science, and a discovery of the highest interest to the cause of learning and of prime importance in the practical affairs of life. By the lahors of the weather hureaus which are now estahlished in nearly all civilized countries, we are just heginning to realize the nature of the element in which we live, and learning how to adapt ourselves to it intelligently. Think of the salmon in the rivers as finding out for the first time the location of the rivers, or the nature of the currents in which they move. How many of the hape, heretofore all uncertainty, and charged to luck or ill luck, hamper agriculture, industry and trade, in their complicated affairs, whicb can yet be brought within the hounds of husiness calculation, through a little more knowledge of our atmospheric element. Health and pleasure, the delights of the season, and the convenience, safety and economy of locomotion hy sea, are all largely dependent upon knowledge which the Signal Bureau is placing within the reach of all.

Go west heyond the limits of the Oregon and California coast 1,000 miles, and the prevailing direction of the wind is from west to east. When it reaches the coast its lower stratum is deflected down the coast hy the trend of the mountains. A sailing vessel from the Sandwich Islands to California runs due north until it has passed from the tropical trade-winds into the temperate blowing in opposite directions.

Mention has already heen made of the fact that our storms travel from weet to east with the prevailing direction of the wind. It follows that in the tropical zone on the Pacific as on the Atlantic, storms rising to the south of us will travel in the opposite direction. To the grand curve of the Gulf of Mexico, whence storms are in the habit of passing over the United States and onward to Europe, we may have a counterpart on the Pacific. We are ignorant of the origin of the etorms which strike our coast. We do not understand why they sometimes etrike in the north, and at other timee in the south. With such problems as these the Signal Bureau is grappling with flattering prospects of suhstantial euccess. In the absence of telegraphic communication from the bosom of the Pacific, or heyond, they are making the best use of the eimultaneoue observations transmitted hy mail. When the Pacific cable is laid to the Sandwich Islands they will he in a position to tell us more ahout the weather for the henefit of shipping. The meager data now published hears no comparison to the fulness and preciseness of that we will enjoy when a sufficient number of stations have been estahlished to develop the system fairly.

Exceptional movements of storme are often brought about hy areas of high and low harometer at the north or south. A rain storm ahout 10 months ago took a grand eweep to the southward through Arizona, and thence in a northeasterly direction along the great lakes, following the usual couise heyond the Rocky mountains. If the deflection was caused hy atmospheric changes, it might have heen hrougbt ahout hy a high pressure due east of the storm center, therehy forcing the storm to move eoutheastward by way of Arizona.

In the latitude of Queen Charlotte island on the plateau of the Cordilleras, the writer, in Septemher, 1876, observed a great storm which moved in tbe normal direction at the commencement—from west to east, after a fall of nearly an inch of the mercury—hut after an hour or two of violent threatening with little rain it turned, apparently, upon itself, the clouds returned, and a terrific rain storm followed, the wind blowing westward. Lieut. Craig remarked that thie was prohahly a storm vortex similar to the cyclonee so often described, the position of the ohserver heing a little distance from the center. That etorm may have entered the United. States from the British possessions in the northwestern corner of Minnesota and followed the lakes.

Sometimes the Signal Bureau feels the commencement of a etorm in southern California, and it comes up over the center of California, moving thence in a northeasterly direction nearly to Montana, or even touching Montana before it resumes a more nearly due easterly course.

Storm centers, it may be ohserved, therefore, are at liherty to vary considerahly from the prevailing direction of the winds. This muet necessarily he the case where the storm center passes from the tropical zone to the temperate zone of regular or trade-winds, the prevailing directions heing opposite. In northwestern Alaska similar causes must hring ahont eimilar results. In the middle of the temperate zone the movements of the storms mentioned as passing from California through Arizona and Montana are examples of the influence of low and high pressure areas, which can be nnderstood hy reference to the published maps of the Signal Bureau. In the Rocky mountains storms are ohserved to move frequently from the northwest to the southeast. They come from British Columbia into Dakota. Further east they are seen to enter the populous Western States from Dakota, and sometimes from Minnesota, sweeping down over the United States in the direction of a low pressure area. The majority of the storms in the Eastern States come from the Rocky mountains, most of them striking for the region of the great lakes.

Some of these storms originate locally in the mountains or plains where the conditions arise. Those of sufficient sweep to cross the continent or the Rocky mountains, come from the Pacific—here. In regard to those that come into the United States from British America, the origin cannot be made out exactly at present, but the eupposition ie that they are developed in the Rocky mountains, unless they come from the Pacific ocean.

On the other side of the Rocky mountains the typical storms form in the neighhorhood of the equator, and move from southeast to northwest until they come to latitude 25 or 30 north, when they curve around to the eastward, describing a parabola.

In our firet article a storm was depicted as rising on the flanks of the Sierra Nevada—or the western rim of the plateau—and the clouds were described as rising into a colder stratum, causing deposition in the form of rain or snow. Let us follow it further: As the storm passes over the plateau, or the Rocky mountains, the harometric pressure is rather greater than hefore or after. This, at least, is the case so far as Old Prohabilities can tell hy the plotted data of the weather charts. In other words, the barometric readings vary there less from the mean than they do on this coast or to the eastward; and the rainfall is for that reason very much lighter in the Cordilleran plateau. It is not a desert merely because the Sierra Nevada has ahstracted all the moisture, hut because the barometric pressure is uniform, and there is no cause in operation to induce the moisture in the clouds to leave them.

The only explanation givcn by Craig for the dry summers of California is that they are due to the existence at that season of less moisture in the atmosphere; and what moisture there is, is not condensed in the latitude of California until the clouds reach the mountains, or higher ground, where they are forced into a cooler stratum of air. It is different in Mexico; and to some extent also in Oregon, Washington and British Columhia, though the tendency toward a dry spell in summer is felt until we reach Alaska.

The change of climate alleged to be taking place in Oregon and in Washington Territory, east of the Cascades, is not imaginary. Craig thinks there is something in it. A great deal has been written upon the suhject of inducing drynese or lessening rainfall hy cutting away the forests. But the suhject has heen superficially treated, and conclusions have been jumped at and crookedly etated, though they may in the main he correct. Treee and plants with peuetrating roots and ahundant shade have the effect to hold the moisture near the surface—drawing and keeping it there after it is once there hy capillary attraction, throughout seasons of drouth which would be severe enough to transform a dry country into a desert; but few plants could hold out through it. A country dotted or partially covered with moisture-holding vegetation would not only keep moist the intervening epaces where there is no forest, to a degree hy drawing the water from the depths to the surface hy sun power, but it would supply the atmosphere with moisture hy a constaut flow through the leaves, doing the duty of a thousand windmills. In that case the atmosphere would also hold more moisture than it otherwise could, and the usual causes might periodically precipitate it in the form of rain. Without the intervention of life at the surface the earth hecomes dry, reverting to its primeval condition hefore it had anything upon it that was heautiful. A crust is formed at the surface, and through that no moisture can escape into the atmosphere. Earth and sky are at odds with each other, heing equally forhidding. It is undouhtedly within the reach of mankind to take pieces of waste country where the rainfall is only from two to twelve inches, and cause the surface to hold the moisture so that the atmosphere can take it up from the natural reservoirs under the eurface. Douhtless the formations and the proximity to mountains holding ahundant moisture would have something to do with it.

So far, however, there has not heen sufficient artificial vegetation started in eastern Washington under the provisions of the Timher Culture act to hring ahout the phenomenon which is to he accounted for. It is only in the scutheastern corner, within a radius of 20 or 30 miles, in the Walla Walla distriot, where much has heen done in the shape of agricultural improvement and planting, though the area is very rapidly increasing.

As to the fact of an increased rainfall having taken place there during the past 20 years, although it is stoutly and circumstantially put forward hy everyhody residing in the district, observatione of rainfall for a decade at least should he taken hefore the fact can he said to he fully established. It is possihle that a cycle of greater rainfall may he again followed hy a cycle of dryness. The Signal Bureau has estahlished a station at the Dalles, and will establish otbers at Lewiston and Colville, or at Cœur d'Alene, wbich will develop the facts and furnish useful data for the flourishing farming country now in process of development through the inflowing of settlers and the construction of the Northern Pacific railroad.

We do not know of any other successful means heyond that above indicated for inducing artificial precipitation. Espy once tried to get an appropriation from Congress to make experiments by starting tremendons fires. Another experimenter in this direction wants to produce rain by firing cannon, on tbe principle of concussion. There can be no douht that if either of these parties could succeed in forcing the moisture-holding stratum of atmosphere up so ae to lower the temperature by the operation sufficiently to condeuse it into drops, the rain ought to come, and the experiments would be successful. Nor ie it beyond the bounde of human possihility that such operatione may yet he performed economically.

The Many Forms of California Mining.

Now that the mines of California are attracting increased attention, more especially in communities at a distance, we are frequently applied to by letter for advice as to the character of our mineral deposits, what may seem to be the most eligible localities in the State for engaging in the business, the amount of capital required for its succeesful prosecutiou, etc. In replyiug to these inquiries it muet be premised that only a very general answer can be given, because of the great extent and variety of our mineral resources and the lack of specific knowledge on our part as to the wants, means and other circumstances of the individual or parties applying for information. The precious metals occur here under such diversified forms and conditions as render a multiplicity of methode necessary for their successful mining, each of these methods being so unlike the other ae to constitute it an essentially different branch of the business.

Thus we have in Inyo and adjacent counties great quantities of argentiferous galena and other silver-bcaring ores that, requiring treatment hysmelting, opening here an extended field for those having experience in this mode of reduction. Then we have auriferoue quartz lodee carrying both free milling and refractory ores, and which, reaching along our main gold belt from one end of the State to the other, present grand opportunities for those having much as well as those having but little acquaintance with practical metallurgy, the exploitation of the veins above mentioned calling for the services of men expert at underground mining. The channels of the buried rivers and the banks of auriferous gravel overlying them afford material for extensive hydraulic operations, tbe former constituting also the sites of the drift diggings, now an important hranch of placer mining in California. The beds of the modern rivers in the mining regions of this State are filled for hundreds of miles with tailings, much of which can be readily rewashed and would well reward the operation. There are placee too along these streams that would pay well for wing-damming, with others that could he profitahly worked throngh tunnels or hy means of steam dredgers.

In the eourcee enumerated reposes mainly the mineral wealth of California, presenting to mining investors a wide and varied field from which to make choice. Not here as in most other countries are those proposing to become interested in mining for gold and silver confined to either one of the precioue metals, or to a single line of the business. It is possihle for them to largely consult their individual fitness, their convenience and tastes and the extent of their meane in emharking in this industry here, which in some of its departmente can he successfully carried on with very little capital. On the excellence of our climate and the superior facilities enjoyed here for prosecuting the husiness of mining we need not enlarge, these heing patent to all and everywhere well understood. Relying upon fresh intelligence derived through trustworthy channels, we will in our next issue try to indicate in a general way some of the districts in this State that eeem to invite the investment of capital, either through new discoveries made or the improved condition of mines previously opened and worked, calling attention also to some localities that offer inducemente for rewashing the tailiugs and inaugurating drift operations.

DEEP BORE.—The artesian well of Mr. J. B. Haggin, located about 13 miles northeast of Sacramento city, has heen discontinued after sinking 2,130 feet without any indications of flowing water. In the opinion of some geologists the stratifications of the main Sacramento valley dip to the east, and hence unfavorahle for a supply of artesian water. Debris, coarse gravel and quartz sand were found at and near the hottom. The quartz sand was submitted by us to a careful examination for gold, but not a trace was discovered. The indications are that the hore stopped in an ancient river hed, which perhaps may he regarded ae a fact, for ahout 100 feet from the sand deposit, the horer passed through an oak tree, which was in a perfect state of preservation. Between the oak tree and the sand a stratum of hydrogen gae was tapped. The gas hurned with a hlue flame. A singular circumstance, as hydrogen gas is rarely found in such localities. This well is on the Norris grant, and its progress has been noted from time to time in the PRESS.

Ancient Mine in Mexico.

Recent Discovery in Sinaloa.

We translate from *El Minero Mexicano* an account nf an important discovery. It appears that in the year 1830, Justo Contreras, an old man, over seventy years nf age, announced his discovery nf a rich treasure, without mentioning in what it consisted. The discovery was made somowhere near Point Huagino, in the mineral district of Cosala, State of Sinaloa, what is now known as "San Miguel de Huaginn." Don Francisco Alvarez and J. M. Chavez, to whom the information was given by Cnntreras, accompanied the latter to the locality of the supposed treasurs, but as considerable time had elapsed all traces were lost, or Contreras, in his senility, had forgotten them. He was accordingly disbelioved, but ho insisted and mado known his discovery to others, who were likewiso disappointed in their search. So the matter dropped.

Forty-eight years afterwards the matter was again called to the attention of the same parties by a cattle herder, who accidentally found a rich piece of ore containing gold and silver, in a ravins about three-fourths of a league southeast from Point Huagino. While looking for lost cattle, he noticed the glittering stone, and picking it up he brought it to Senor Chavez. Having located the place, Senor Chavez, accompanied by Don Quirino Navarrn, found the ancient Rancho "Brasil," near the same place where Contreras had declared his find, hut in an opposite direction. The ravine of the drover was easily found from this point, and after passing a cattle trough, and directiug their steps up the ravine towards the hrow of the hill they discovered the terrace of the ancient San Miguel mins. The vein of ths mine was also found, which was ascertained to run north and south. The ore found hy ths drover had apparently rolled down from the terrace into the ravine where it was found. This terrace, or plateau, is an artificial plane, with an incline of 60° and more than 200 yards in width and length, reof ths mine, which could not he traced from the ravins helow. Upon the plateau evidences of fire ahound, and the particles of gold and silver scattered over the surface of the ground, mixed with the coarss gravel which served as a matrix, and other evidsnces, afford indications of a rich dsposit which a practical miner would understaud and rarely mistake.

After careful inspection it was found that the ancient mine, though buried in debris, remained as it was left hy the ancient miners. Several excavations or shallow shafts wers found, all containing gold and silver gravel, which an expert pronounced rich in gold, even the low grade ore:

There are numerous traditions concerning this ancient mine, and so faint are the traces of the aucient mines that comparatively nothing will ever he known, uuless the mine itself should contain further evidences. It appears from this tradition that prohahly 200 years ago a rich mins was ones worked on a hill opposite Point Huagino and southeast therefrom. This hill was unknown as to location and had no name. It was eagerly sought hy treasure hunters who had learned that the mine proper had heen concealed hy timher, hut no trace of its entrance was ever ascertaiued.

All the old people of the Huagino were unanimous in the helief of the existence of the mine, and the tradition had come down from father to son for an unknowu period of time. Santiago Lahrado, an old man 118 years of ago, had heard his father say that his grandfather had spoken of this mine. Herders, in hunting their cattle, had fouud tracea of refining ovens on the Huagino Rancho in localities where tradition had fixed the residence of ancient owners of the mine. Quirino Navarro saya that when he huilt hia house he got the foundation stones from an ancient "casa grande," and that the stones contained evidences of gold and silver. These atones still exist. Many metallic instruments have heen disinterred, from time to time, near this "casa grande," hut have heen unfortunately lost or destroyed hy those who found them, not even the oldest inhabitant knowing their use. A large quantity of lime, debris or amalgam, aimilar to that taken from the Alcaparrosa mine, has been found near these old refining ovens, and judging from their weight they are heavily charged with lead. It ia said there was a mill, and, indeed, large atones, hurred like mill stones, still exist.

Considerahle lahor is heing expended to clean up the plateau, in order to uncover the entrance to the mine. The debris is so rich, howevor, and paying that the work is delayed hy extracting the gold and silver. The quantity of debris is immense, and extends over the plateau and partially fills the ravine. It is determined, however, to proceed with the work so as to uncover the timher-hidden entrance to the mine. That such a mine exists, and that it contains a vast treasure, there seems to he very little douht. It appears that years ago a sudden plague hroke out in this region which was so sadly destructive that the inhahitants had no other thought than to conceal their treasures and fly for their lives. From Sinaloa and Sonora the locality nf Huagino was the most suitahle, Guadalajara and Durangn heing too far distant, and tho highroads furthermore thronged with thieves. So it is extremely probahle that all the treasures were deposited here ; in fact romains of a highroad from Sinaloa and Souora to this point exist at the preseut day. Tho panic-stricken people either died, or, becoming unahle to return, their treasures remained unknown except to tradition. It was the panic which happened in 1834. Whou tho cholera first mado its appearanco in Sinaloa that revived the tradition concerning Huagino. Tho rocent panic having had ths samo effect as the aucient one, viz: tho desire of tho inhabitants to secreto their valuahles in somo common locality and fly for their lives from the dread disease. It is certain, at all events, that at some ancient period thers was a suddeu and violent flight of the people, and in the direction of Huagino. In the archives of Conitaca there are now documents wnich declare the fact of ths existence of this mine and that it was abandoned hy reason of the appearance of a desolating plague, and that ths miners, hefore abandoning their works, carefully concealed the entrance to the mine, leaving their furnaces, ovens, etc., as the least valuahle. Not far from the locality of the mine there is a largs plateau, or *mesa*, covered with cat-tail, among which numerous pieces of ancient pottery have been found in such situations as would indicate an encampment of a great multitude. The fact that the ancieut miners took such precautions to conceal all traces of the mine, thus indicating that to he the principal object of their solicitude, points induhitahly to the existence of a vast treasure within the mine. The veins so far are quartz and true fissure veins.

As soon as further developments are made they will he imparted to the public.

FIG. 1. GEYSER, SHOWING ORNAMENTAL CHARACTER OF BORDER.

Notes on Geysers.

Intimately connected with volcanic phenomena and in fact formiug subordinate volcanic pheuomena, geysers command ths attention and study nf the scientist, as well as excito tho wonder of ths ordinary heholder. Caused fnr soms important purpose in the ocouomy of nature, we should say vent holes for the relief of over-hurdened mother earth, tho true geyser should not ho mistaken for the fumaroles, the so-called geysors of California. Ths true geyser is found only iu Iceland, in ths Yellowstone Park of tho United States and in New Zealaud. Iceland is an essentially volcanic plateau, olevated about 2,000 feet above ths sea level, with only a narrow marginal hahitable region sloping gently to the sea. Upon this elevated plateau exists every sort of volcanic action, viz.: lava eruptions, solfataras, mud volcanoes, hot springs and geysers. These last exist in great numbers; more than 100 are found in a circle of two miles diameter. One of these, the Great Geyser, is well known to our readers.

In magnificence of geyser displays, Iceland is far surpassed hy ths geyser hasin of Firs-Hole river, in the Yellowstons region. This hasin is only ahout three miles wide. Around it are ahundant evidences of prodigious volcanic activity in former times, and secondary volcanic phenomena are developed at the present day on a stupendous scale, and of every variety. More than 10,000 vents of all kinds are found in this vicinity. On Gardiner's river, the hot springs are mostly lime depositing; on Fire-Hole river the geysers deposit silica, containing an enormous quantity of diatomaceous formations, some of them of a marine species mixed with all the varieties usually common to fresh water.

The geysers are generally surrounded hy hive-like elevations, ornamented in some cases in the most exquisite manner hy a snowy deposit from the hot geyser waters, in the form of scalloped embroidery set with pearly tubercles. The illustration in Fig. 1 will show the appearance of these surrounding dsposits.

In some places the silica is deposited iu large quantities, thres or four inches deep, in a gelatinous condition like starch pasto. Trunks and branches of trees immersed in these waters are sneedily petrified. The water of geysers is simple spring water, and they are true springs and not volcanoes. Mackenzie supposes that the eruptions are caused by the condensed steam of heated water seeking a vent and forcing the water up through tho geyser pipe, as in Fig. 2; *a* shows the opening into the geyser; *b*, ths chamber in which tho steam condenses. As tho steam accumulates it forces tho column, *c*, up through the opening or vent at *d*, with greater or less force, according as the supply of steam is greater or less, and then when the steam has escaped, the geyser returns to its quiescent state until another accumulation occurs. This theory, however, seems to he untenable on the ground that it is incouceivable that all of the many thousands of geysers should have a separate cone and conduits so peculiarly constructed. According to Bunsen, ths geyser does not possess a cave or even a perpendicular tube, ready mado, hut, like volcanoes, makes its own tubo.

Fig. 3 is an imaginary section of a geyser mound, showing tho manner in which, according to Bunsen's view, it is found.

The irregular line, *b, a, c*, is the original surface, and *a* the position of a hot spring. If the spring he not alkaline, it will remain an ordinary hot spring; but if it bs alkaline, it will hold silica in solutiou, and it will be deposited about tho spring. Thus tho mound and tubs are gradually huilt up. For a long time the spring will he *boiling*, but not eruptive. But as the tubs hecomes longer, aud ths circulation more and moro impeded, the differens in temperature between the upper and lower parts of the tube hecomes greater aud greater, until finally the boiling point is reached helow, while the watsr ahovo is comparatively cool. Then the eruption commences, and ceass upon the withdrawal of the cause.

Now, we supposs the geyser to havs a simple hut irregular tube, without a curve heated below hy volcanic fires, or hy still hot volcanic ejections. Now, the temperature of the water in the tube increases rapidly with the depth, hut is, at every depth to which observation extends, short of the hoiling poiut for that depth. Let abscisa *a d* represent depth iu the tube and also pressures, and tho corresponding temperature be measured on the ordinate *a n*. If, then, *a b, b c, c d*, represeut 33 feet depth, or one atmospheric pressure, the curve *e f*, passing through 210°, 250°, 275°, and 293°, would correctly represent the inercasing boiling points as we pass downward. This curvs may he called ths curve of hoiling point. The liue, *a g*, commeucing at the surfaces at 180° and gradually approaching the hoiling point line, would represent quiescence. Now, at the moment of eruptiou, at some poiut helow the reach of observation, ths line *a g* actually touches the line *e f*—that is, ths hoiling point for that depth is actually reached. As soon as this occurs, water in the lower portion of ths tuhe would he changed to steam, and its expansion would lift the whole column of water in the tubs, and cause it to hulge and overflow the hasin. As soon as the water overflowed, ths pressurs would hs diminished in every part of the tuhe; and a large quantity of water hefore very near the hoiling point would flash into steam and instantly eject the whole of the water remaining in the pipe. The steam itself would rush out immediately afterward.

The premonitory canuonading heneath is produced by the collapse of large steam hubbles rising through the cooler water of the upper port of tho tube; in other words, it is *simmering on a large scale*. An eruption is more quickly brought on hy throwing stones into the throat of the geyser, hecausc the circulation is thus more effectnally impeded.

Fig. 4 will illustrate this theory. The apparatus is an artificial geyser, and consists of a tuhe of tinned sheet-iron, about ten feet long, expanded into a dish ahove for catching the cruptcd water. It is heated also, a little helow the middle, by an encircling charcoal chauffer, to represent the point of nearest approach to tho hoiling point in the geyscr tube. When this apparatus is heated at the two points, aa showu in the figure, the phenomena of geyser eruption are completely reproduced; first, the violent explosive simmering, then the overflow, then the eruption, and then the state of quiescence.

Fig. 2.

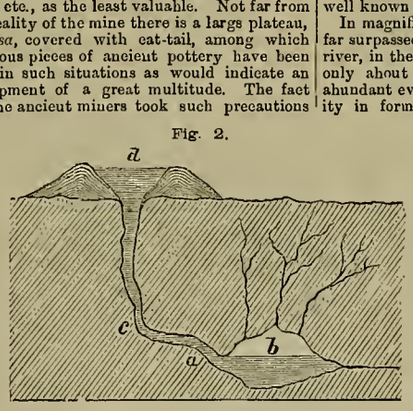

Fig. 3.

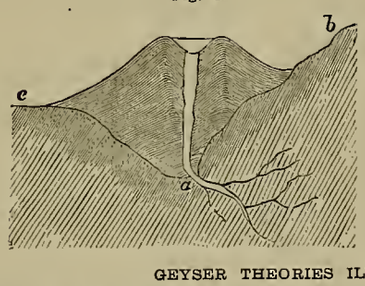

Fig. 4.

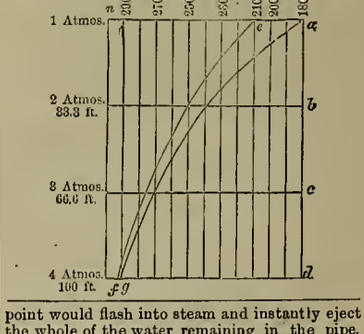
GEYSER THEORIES ILLUSTRATED.



A TERRIFIC hail storm, six miles wide, passed from west to east near Germantown, Columhia county, N. Y. The hail-stones were as large as hickory nuts, and panes of glass were hroken in every farm house. Poultry was killed, fruit of every kind destroyed, trees uprooted, fences hlown down, and near Clermout one or two housea were unroofed.

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the License of this Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradise Valley, Jefferson, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Plomoses.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

WASHING! WASHING!

Prices Reduced! Prices Reduced!

La Grande Laundry,

13th Street, Between Folsom and Howard.

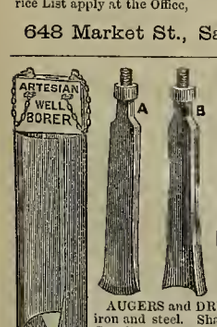
PRINCIPAL OFFICE,

648 Market Street, S. F.

Office open from 7 A. M. to 9 P. M. Saturdays to 11 P. M. Washing called for and delivered to any part of the city free of charge.

All orders receive prompt attention. For circular and rice List apply at the Office,

648 Market St., San Francisco.



ARTESIAN AND SURFACE Well-Boring TOOLS.

Manufactured by the

Rust Well Auger COMPANY, OF MACON, MO.

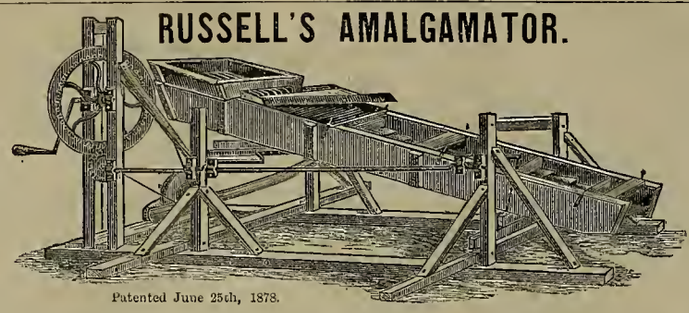
AUGERS and DRILLS from best wrought iron and steel. Shafting is 2-inch gas pipe. Couplings are round plugs fitted inside the pipe. Drills fitted for rope or pole. All tools *warranted*, and sold for less money than can be got elsewhere.

Send for Circular. O. RUST, Macon, Mo

C. C. Bitner's Apparatus for Obtaining Metallic Copper from its Solutions.

Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address O. C. BITNER, Spenceville, Nevada County, California.

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

J. MORIZIO, Gen'l Agt.,

Room 24, Safe Deposit Building, Corner Montgomery and California Streets, SAN FRANCISCO.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

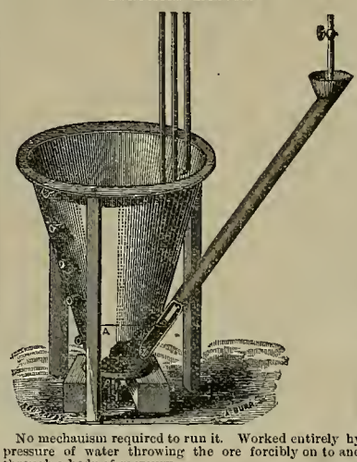
To be obtained of CROSS & CO., San Francisco.

STEVENOT'S

Fine Gold Amalgamator.

Adapted for Ores, Tailings, Slimes, Etc.

Unequaled for Cheapness, Lightness and Practical Results.



No mechanism required to run it. Worked entirely by pressure of water throwing the ore forcibly on to and through a body of mercury.

E. K. STEVENOT,

Chemist and Mining Engineer,

304 Montgomery St., San Francisco.

REPORTS MADE ON MINES. Quartz Mills, and Works of every description started.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Barlow J. Smith, M. D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 638 California Street, above Kearny.

This Institute by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervovital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

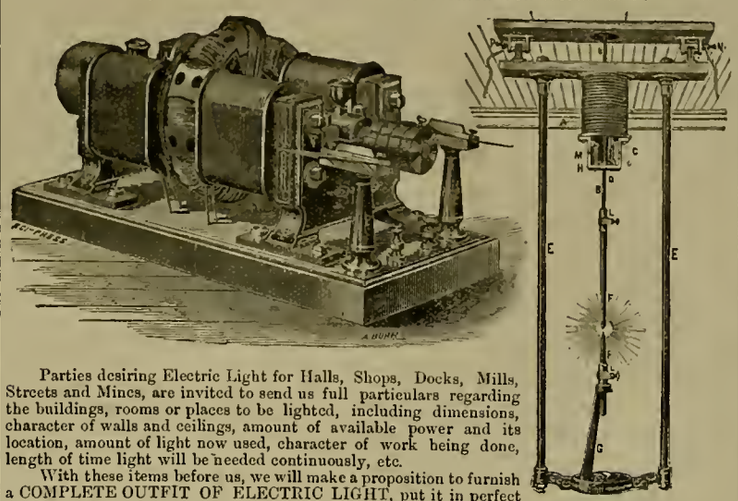
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

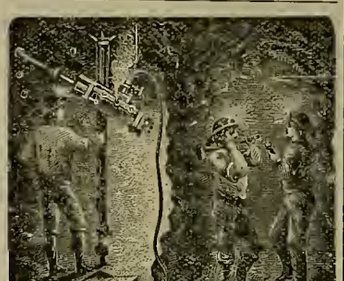
In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.
With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.



In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX, 18 and 20 Fremont Street, San Francisco.

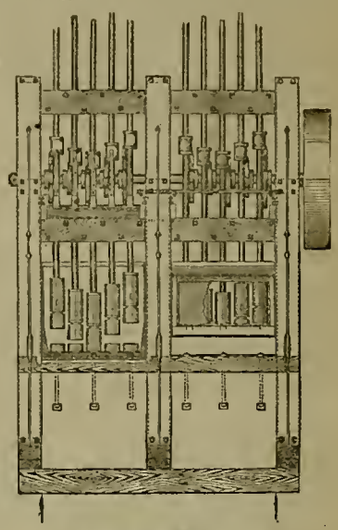
Machinery.

GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

THE IMPROVED O'HARRA
CHLORIDIZING FURNACE.

Patented Sept. 10th, 1878.

Now in Operation at the Extra Mining Co.'s Works, Copper City, Shasta Co., Cal.

Two men and two cords of wood roast
Forty Tons of Ore in Twenty-four Hours,
Giving a full chlorination (100%) at a cost of 30 cents per ton. Address,

O'HARRA & FERGUSON,
Furnaceville, Shasta Co., Cal

Or CHAS. W. CRANE, Agent,
Room 10, Safe Deposit Building, San Francisco.

Dewey & Co {202 Sansome St.} Patent Ag'ts

Continued from page 397.

in value, taken from third class ore, which is working 89% of the assay value. The company commenced on their low-grade ore, so as to fill up all chinks and cracks with low-grade pulp. The mill works beautifully in every particular. It is expected they will turn out $20,000 bullion per week, which will be shipped directly east.

CLIFTON.—The Longfellow mining company turns out 8,000 pounds of copper mattling per diem. New furnaces are being put up to treble the yield. A large business in charcoal is being done here. It is transported from the Burro mountains, a distance of 100 miles, and costs one and a half to two cents per pound delivered here. Eighteen tons of ore are daily put through the furnace. A railroad from the mine to the furnaces will be completed by January 1st.

FLORENCE.—One bar of silver, weighing 1,100 ounces, arrived to-day from the Isabella mine, Globe district.

COLORADO.

LEADVILLE.—Denver *Tribune*, June 11: The Pendery shaft is 200 ft deep, and the mineral thus far taken out is of high grade, and easily worked. A new ore and shaft house has just been completed, and hoisting is done by machinery. The ore bucket holds about 600 pounds, and a round trip from the top of the shaft to the bottom and return is made in about five minutes. Running to its full capacity this mine can turn out 75 tons of ore every 24 hours.

QUARTZVILLE.—Quartz creek, 27 miles from Gunnison, has developed mineral resources. Two miles north of town is the Terrible, supposed to be a true fissure vein between porphyry and limestone, carrying gold largely as well as silver and copper. The gold is visible. The Western Hemisphere, at the head of Hall's gulch, is a true fissure vein in place between porphyry and limestone. The ore carries silver, copper and lead, and is considered high grade—showing six ft of mineral. The Fairview and New Dollar, north, and the Red Jacket, south of town, are among the best developed leads in the district. Forty ft is the greatest depth attained on any; and the ore from Fairview is stripped as fast as taken out, paying expenses so far. The whole district is a mass of silurian, limestone and porphyry, overlying the granite, and near the summit north, against the granite, presenting the appearance of having been upheaved. The carbonate field is extensive.

IDAHO.

ROBERTSON PROCESS.—*Idaho Democrat*, June 11: We called at the Hoskins furnace and arastra the other day and found the boys busy roasting and crushing rock. The arastra is run by water power. The furnace is built of brick, and is similar to a baker's oven. They say the new process (Robertson) is working admirably and increases their rate of crushing at least one-half, besides enabling them to save all the gold. This company are first to put the Robertson process in operation in this Territory, and their success will cause others to follow suit. Their works are situated at the mouth of Robie gulch, about 12 miles from this city, and near the stage road connecting Boise and Idaho City.

BULLION valued at $3,573 arrived at Winnemucca from Silver City, Idaho, on the 5th.

IDAHO CITY.—There is an immense mass of debris along More creek which it is proposed to work up by fluming the creek and running the accumulated mass of tailings through into the canyons below. There is plenty of water and wood. The bottom or paying ground is from 300 to 2,000 ft wide, and the mass of tailings from 30 to 50 ft deep. There is an extent of hundreds of acres of the richest mining ground in the basin, and a depth of from 15 to 60 ft, all of which could be swept through this flume; besides, there are whole hillsides that could be piped in as the flume is extended. This would not be a temporary investment, but it would take a lifetime to run it all through and clean-up the immense area of bedrock, and the company who will invest and successfully carry out this grand enterprise will be able to count their gold by millions of dollars. There is another just such opportunity on Orimes creek.

BOISE CITY.—*Statesman*, June 12: There is no decrease in the excitement about the new ledges in the mountains near this place. Parties of prospectors are daily going out and returning with rich specimens of surface quartz; many reporting that they have discovered well-defined veins.

SUB ROSA MINE.—Idaho City *World*, June 10: The lessees of the Sub Rosa mine have 75 tons of ore in the ore house, and plenty more in sight.

MONTANA.

BUTTE.—*Miner*, June 10: In the main shaft of the Alice the rock, which has been very hard, is becoming softer, and better progress is reported. The shaft is now about 445 ft deep. At present rate of progress the point for starting the 500-ft cross drift will be reached early next month. The Penobscot mill, in the Stemple district, has been increased to 40 stamps, and 20 more, to raise the battery to 60 stamps, are on the way to Vestel. William Mayger is putting up a five-stamp silver mill, with power for another battery. It is located half a mile below Belmont, and just under the Drum Lummond lode, a 50-ft vein, carrying both gold and silver. The Colorado and Montana smelting company, through their Manager, Mr. H. Williams, have purchased of the Gagnon mining company the smelter erected by R. K. Williams & Co., on the flat across the creek from the Dexter mill. The furnace already built will be removed and another of suitable material and after a more improved plan put in its place. The building now standing will be increased by an addition 50x156 ft, with a shed 22x40 ft, premises of these dimensions being required by the furnace room, ore rooms, etc., of the works. To begin with, no refining works will be erected by the company; but instead, ore will be reduced only to matte. From 6 to 12 tons, according to its grade, will be reduced to one ton of matte, which, being ground and sacked, will then be shipped to the Blackhawk, Colorado works for final treatment. Sites, Fisher & Co. will start up an arastra within three miles of Beaver creek station (Rodgers'), and within a mile of the Radersburg road, some time next week. They own three lodes. On one that carries from 18 inches to 6 ft of ore, they have opened a tunnel 150 ft in length.

LEXINGTON.—A drift started from the lower level some two months ago, has been driven in on the north spur for the entire length of the ore chute, 116 ft as above. For this distance the spur has an average width of four and a half ft, and its ore, instead of yielding 70 or 80 ounces, as was expected, averages over 300 ounces of silver per ton, besides being rich in gold. Since visiting the mine we have been shown the records, kept in the office of Mr. M. E. Mayer, of assays make from north spur ore. From a long list we select six found in succession. Here they are: Three hundred and thirty-seven ounces of silver, and $31 gold per ton; 328 ounces, and $75; 148 ounces, and $100; 805 ounces, and $502; 1,080 ounces, and $286; 671 ounces, and $270.

NEW MEXICO.

LYONS' FOUNDRY.—*Grant County Herald*, May 24: Thomas Lyons' foundry, near the southern edge of town, has been running almost constantly during the past two or three weeks. The furnace is a brick cupola, with a capacity of about 5,000 pounds of molten iron for each day's run. The blast is furnished by a No. 9 Sturtevant blower, run by an eight-horse power engine. The fuel is oak charcoal. The foundry is specially fitted for the casting and turning of stamp-heads, tapits, cams and every class of quartz mill attachments requiring heavy boring. A fine quality of molding sand is found in the arroyo just below the foundry. Mr. Lyons is prepared to turn out any description of casting from 1,500 pounds in weight down to the most minute article required in the machinery of a quartz mill. The patterns for the foundry are manufactured by Black & Cosgrove. The foundry is now being run upon such scraps of iron as can be gathered from occasional sales of that material; but if proper encouragement is given, Mr. Lyons will erect a blast furnace, and commence the reduction of iron ore. His mine, near Santa Rita, shows a heavy body of magnetic ore, running at least 60%, and he feels confident that this ore will return a very superior quality of pig iron. He now charges 15 cents per pound for his castings, but if the quartz mills of Silver City would patronize him, this price would be greatly reduced. Connected with the foundry is a patent brick press, for the manufacture of fire bricks. The clay is brought from the hills just above the Mimbres reduction works, and the brick will stand more than four times the amount of heat, in a cupola lining, than the St. Louis extra fire brick will stand. This by actual test of four and five days' run.

ITEMS.—Miners about Lone mountain are pushing work upon their leads, and the most of them have a splendid showing of ore. The Lone Mountain mill is now running on a batch (eight tons) of ore from the Commercial, sent in by George Smith. The ore assays, on an average, 250 ounces to the ton, and Holson can be relied upon to work it close.

UTAH.

ITEMS.—Salt Lake *Tribune*, June 12: Yesterday Wells, Fargo & Co. sold one car of Horn Silver bullion for $1,613.50, and shipped to Chicago two cars, valued at $4,000. On the 9th and 10th, Warnock & Co. received 89,506 pounds of Horn Silver bullion. The Union Pacific Express Co. yesterday received four bars of bullion from the Ontario, valued at $3,179.75; four bars from Leeds, $4,773.39; four bars from the Ontario, $3,398.38; total, $8,171.77.

International Meteorological Congress.

The International Meteorological Congress, recently convened at Rome, terminated its labors after a brief and rather hurried session, by referring much of the business for which it was convened, to the discretion of a committee originated by the Congress; the decisions of the Congress itself have not been therefore numerous. The meeting was large with quite a general enthusiasm on the subject of international meteorology.

The Congress has recommended that for each country daily synoptic weather charts be made for study, as has been the daily practice for the United States since 1870; that storm tracks should be traced; weather notices given to farmers; winds, temperatures, etc., studied by the month and by the year; instruments at all stations compared with each other; the general march of weather phenomena over the surface of the globe noted; uniformity of observation sought for, and other procedures, as has been long the customary plan on this side of the Atlantic. There are evidences of progress in this.

On the subject of observations actually simultaneous, first originated and practically put in use by the United States in 1870, and the basis of observation on which the greatest advances and success have been made by this country, it was resolved "that the Congress is of the opinion that the development of simultaneous observations contributes much to the progress of meteorology, and that all works which are undertaken in this direction, ought to be encouraged."

The publications of the Signal Office, such as the Monthly Weather Review with the Synoptic and International Weather Charts were referred to with approval, and with the recommendation, "that the Congress is of opinion that the publication of a similar Review would contribute much to the advancement of meteorological study, and is therefore recommended to be made for Europe." There can be no higher compliment.

Finally, the Congress asks that the stations, as Mount Washington and Pike's Peak (the highest stations on the earth), may be maintained, making even more observations than those now attempted, and that all the observations may be published for the use of all meteorologists everywhere, as an approval of those stations, the utility of which was once questioned.

It is on these points only the acts of the Congress have any special reference to the meteorological work of the United States. It is satisfactory to notice so much of approval and adoption, and so general a wish for the continuance and extension of it. The Congress made no practical suggestions as to weather predictions in Europe, a matter which, it would seem, might have been arranged with very little difficulty.

HOT AIR, OR HAMMAM.—It has been shown experimentally that hot air is a cure for lung diseases, at least in their incipiency. The theory of it is that the heated atmosphere breathed into the lungs cicatrizes the lacerated or diseased tissues and effects a permanent cure. In view of the fact that lung and throat diseases prevail here as well as elsewhere, it is well worth an experiment, even if the result should be only a re-invigorating of the system. For the general health this experiment may be tried in the Turkish bath. *Hammam*, or hot air, in combination with cold air, warm and cold water, motion, friction, and electricity, as practiced by Dr. A. M. Loryea, at his splendid bathing establishment, Nos. 11 and 13 Dupont street, is entitled to more than a passing notice. Whoever benefits suffering humanity is entitled to some regard, even if a small pecuniary compensation is required, and in this respect we mention the Hammam baths. The most perfect order and cleanliness exists, and an air of refinement and luxury pervades even the atmosphere of the rooms, so that the most delicate organization need not fear any rude shocks. The physical system, through the instrumentality of the baths, receives so thorough a renovation that it is scarcely credible so simple a treatment can produce so wonderful an effect. It would require columns of interesting matter to describe the mode of operation and results, but suffice it to say that no one who receives the treatment once will find it necessary to undergo any other treatment. We do not of course claim a miracle in the healing art, although the general toning up of the system and delicate lung and other tissues of the body borders upon the miraculous.

Electricity in Harness.

A correspondent writing to the *Petit Journal* from Sermaize (Marne), France, May 15th, says: "A complete revolution is about to occur in mechanical industry, and the great problem of electricity as a motor is henceforth solved beyond a doubt. Every day experiences in electrical manipulations demonstrate perfect success in the use of electricity as a motive power. The proprietors of the sugar refinery of Sermaize have, after many trials, succeeded in unloading their beet barges by means of an elevator worked by electricity, 100 meters distant from their factory. The pulper of the refinery receives its motive power from the same source. It is astonishing to witness the working of machinery without visible power, and two small wires conducting the electricity 700 meters the sole explanation of the cause. The success of the experiment has decided the proprietors to adapt the same system to their entire works. By means of a steel cable a power equal to eight oxen will be generated. Many spectators, curious and scientific, visit the works from other departments, and express the utmost astonishment at the novelty."

Now, in view of the fact that one pound of zinc costs ten times as much as a pound of coal, in other words, as any magnetic motor will he 60 times as expensive as a steam motor of the same horse power, it is difficult to perceive how this French invention will succeed in point of expense. There is no better agent than zinc for producing electricity in batteries. Then, too, the modern dynamo-electric machine, while affording another source of magnetism, requires a powerful steam engine to run it; more powerful, indeed, than the effect sought to be produced. The writer promises further developments, and we certainly await them with considerable anxiety. We know, however, that economy is the great desideratum with French manufacturers, and hence, if the motor is adopted successfully, as it appears to be, we will confess that all of our calculations have been wrong, and that we know nothing at all about magnetic motors.

New Double-Acting Deep Well Pump.

Messrs. Thompson & Evans have lately devised a new steam pump, and practically illustrated its perfect working qualities in that built by them for the Hammam baths, and now in constant use by that establishment to draw water from an artesian well. It is a double-acting force pump, and a direct-acting engine, with yoke and sliding block attached to crank, and is automatic in its workings. Capable of from 20 to 150 revolutions per minute, it draws and forces a three-inch stream of water 120 feet, and at moderate speed will supply 5,000 gallons of water per hour. In conversation with the engineer at the Baths, he declared that a steam pump cannot be manufactured that will work easier and quieter, and a personal observation justified his assertion, as it works very silently and regularly.

This pump will run to its full capacity on 35 pounds of steam, and it can be regulated at any rate of speed and is much smaller than a steam pump formerly used at the Baths, which required from 70 to 100 pounds of steam to do the same amount of work. It is settled that 20 pounds of coal per hour will run the pump to its full capacity. The special feature of this steam pump is its double-acting water cylinder, arranged to be placed in a deep well. The one at the Baths to which we refer, has its water cylinder at a depth of 80 feet in the well. Several others of the same type are now being made. The same firm have manufactured a small and cheap engine of from one to seven-horse power, especially for the use of farmers and general work of all kinds, occupying small space and doing a large amount of work on as small a consumption of fuel as possible. A small size engine of this latter kind can be set up complete for $75, or at $50 per horse power.

ARTESIAN WELLS.—William Stack, of Oakland, has lately completed an artesian well adjoining his store, on the northeast corner of Fifth and Harrison streets. The well is an eight-inch bore in the clear, and 113 feet deep. The water, of which there is an abundant supply, rises to within six feet eight inches of the surface. Mr. Stack has several tenement buildings in the vicinity of the well, and his enterprise is calculated to give an abundant supply of good water; most decidedly in favorable contrast with the mere surface supply provided by the San Francisco and Oakland water companies. The formation is as follows: Surface soil, 6 feet; hardpan, 40 feet; blue clay, 62 feet; fine water gravel, 5 feet; total, 113 feet. About four feet above the gravel, the borer passed a stratum of what were supposed to be oyster shells. We cannot commend too highly an enterprise of this kind. In a region where the water supply from subterranean sources is so abundant and so pure, the public demand, and will have, water that is drawn from sources not exposed to contamination. Public and private health requires it, and the increase of the knowledge of health requirements will override the desire for profit at the expense of health and comfort.

News in Brief.

PARADISE VALLEY hogs are fattening on grasshoppers.

GUAYMAS wants San Francisco to let it be a rival port. Go ahead.

YANKEE FORK is making heavy drafts on Nevada. Too many tines on that fork.

THE tunnel under the Detroit river will be completed within two years, and will cost about $1,500,000.

SEVEN bridges on the Warsaw and Vienna railway have been carried away by floods. Traffic is interrupted.

It is said that hay will be worth $75 per ton in Austin, Nevada, next winter. Meat and potatoes would be a cheaper diet.

THE Hungarian General Turr, initiatory of the Panama canal scheme, will probably accompany De Lesseps to Panama.

THERE should be more uniformity in wages. The wages of sin are death, while the wages of Tom Scott, as railroad president, are $100,000 per annum.

THE Guadalupe ranch and the surrounding locality in Lower California was burned over a few days ago, destroying thousands of acres of feed.

THE weather in New York has been very cold and the signal officer predicts it will be still colder, with frequent frosts throughout the Middle States.

THE beach at Galveston, Texas, is the largest and broadest in the world, extending 25 miles, fronting the unbroken tide of the Gulf of Mexico on the south and east.

CORK is coming into use in Germany as a filling for winter bed-coverlets in place of feathers. It is described as not only being warmer and lighter, but decidedly cheaper.

A CYCLONE passed over Sandersville, Ga., June 12th. The Catholic church and many trees were blown down, and fencing and crops sustained considerable damage. No lives lost.

THE New York *Evening Post's* financial article says: The fever for mining stock venture is rising, notwithstanding the profits of mining are collectively not so large as the profits of agriculture.

A VIOLENT storm, accompanied by hail, passed over the city of Trenton, N. J., at 5:30 P. M., June 12th, uprooting trees and doing considerable damage. A washout occurred on the Pennsylvania railroad, delaying trains for a while.

NORTH ADAMS, Mass., has been visited by a heavy freshet, and the damage throughout the vicinity is variously estimated at from $100,000 to $150,000. Damages by the flood in the outlying districts are hourly reported.

THE whole number of languages spoken in the world amounts to 2,553; 587 of these are spoken in Europe, 396 in Asia, 276 in Africa and 1,264 in America. The inhabitants of the globe profess more than 1,000 different religions.

A TERRIFIC storm passed over Bordentown, N. J., June 12th. The rain fell in torrents, accompanied by wind and hail. Trees were uprooted, roofs carried away and several buildings blown down. A mile below the storm was not felt.

CONTINUED shocks of earthquake, which are attributed to the action of Mt. Etna, have occurred near Santa Venere and Guardia, Calabria Citra. Several houses have fallen. Others are in danger of falling, and there has been some loss of life.

OREGON thinks the heavy rain of the 6th was a curse, while Humboldt county sings "thankfulness to the Lord" for a glorious shower; Tuolumne had 23 inches of rain, and Amador county declares rain on Tuesday and a thunder storm on Wednesday very peculiar weather at this season of the year.

THE *Commercial* this evening says the Panama route will not be satisfactory to merchants of New York doing business with China and Japan. By overland connection, the cargo, consisting of teas, silks, etc., only broke bulk once before reaching New York, and that was at San Francisco. Besides loss of time, the deterioration of merchandise by transfer to a tropical climate is urged as a reason why merchants are unwilling to return to the Panama route, and many would choose in preference the Suez canal route, thereby throwing the carrying trade into British hands; the difference of time being made up by the advantages of maintaining bulk and the prevention of sweating.

DO NOT PUT OFF.—It is a fact that should be known to our patrons, and if known is frequently overlooked in the hurry of personal affairs, and that is our agents map out their routes so as to be able to visit every locality systematically. And hence when they are compelled to "double" as it were on their collecting routes, their labors become very arduous. We would be glad if every one would be ready to settle with them at first sight. The circulation of the paper is large, and our numerous subscribers scattered far and near, and as we must look to expense in order to produce as good a paper as we endeavor to do, our patrons should assist us in our endeavors by promptly settling with our agents, not putting them off as if they had but one single collection to make, or traveled about with electric speed.

THE total coinage of the several Government mints during the month of May amounted to $5,213,258, of which $2,878.550 were in double and quarter eagles, $2,330,000 in silver dollars and $4,708 in five-cent, three-cent and one-cent pieces.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO.'S Mining and Scientific Press Patent Agency.]

By Special Dispatch from Washington. D. C

For the Week Ending June 10th, 1879.

216,303.—Lubricator—D. P. Baldwin, S. F.

216,308.—Machine for Reducing Coin-Blanks—F. X. Cicott, S. F.

216,313.—Elevator—F. J. Cronch, Eugene City, Ogn.

216,325.—Mining Flume—J. Howe and N. Waite, Shasta, Cal.

216,326.—Hydraulic Lift—W. B. Hyde, Oakland, Cal.

216,270.—Vehicle Wheel—L. B. Lawrence, Monticello, Cal.

216,338.—Sectional Nut and Collar—E. M. Morgan, Santa Cruz, Cal.

216,151.—Steam Packing—Geo. P. Phillips, Gold Hill, Nevada.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

In New York the contract by which the Fuller Electrical Co. engages to supply the electric light to Madison Square Garden, for a term of months, has just been signed, and the project will be put in execution immediatcly. The garden will be lighted by means of four lamps, 2,500 candle power, for three and a half hours per uight, at a cost of ahout eight dollars to the proprictor of the placc. This is, in the absence of exact calculations, estimated to be from one-third to one-fourth the present cost of lighting the garden hy gas.

Every new subscriber who does not rceive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and subscribers against the acts and mistakes of others.

OUR AGENTS.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. Tharp—San Francisco.
B. W. Crowell—California.
A. O. Knox—Pacific Coast.
S. V. Blakeslee—State of Nevada.
G. W. McGrew.—Santa Clara county.
Milton Kennedy.—Korn and Inyo counties.
J. B. Bachelder.—Shasta County, Cal.
H. H. Messenger—Arizona.
J. H. Wheeler—Mono county, Cal.

Fresh attractione are constantly added to Woodward's Gardens, among which is Prof. Grubor's great educator, the Zoographicon. Each department increases daily, and the Pavilion performancee are more popular than ever. All new noveltiee find a place at this wonderful resort. Prices remain as usual.

How to Stop this Paper.—It is not a herculean task to stop thie paper. Notify the publishers by letter. If it comee beyond the time decired you can depend upon it we do not know that the subscriber wants it stopped. So be eure and send us notice by *letter*.

Settlers and others wishing good farming lands for eure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who hae some 15,000 acree for salo in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

Sample Copies.—Occasionally we eend copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending ite circulation. We call the attention of each to our prospectus and terms of subscription, and requeet that they circulate the copy sent.

Extra Copies can usually he had of each issuc of tbie paper, if ordered early. Price, 10 cents, postpaid.

Printer's Proof Press, complete and in good working order, for sale at this office, at the low price of $30. Call and see it.

Experimental Machinery, drawings, patterne, models, all kinde of electrical and telegraphic apparatue to order. See ad. F. W. Fuller, 415 Market St., eccond floor, S. F.

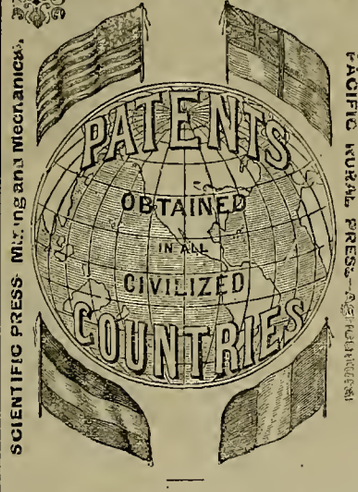
DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.



The Mining and Scientific Press Patent Agency was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Address,
DEWEY & CO.,
202 Sansome St., N. E. Cor. Pine,
San Francisco,

Mining and Other Companies.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Trustees, held on Wednesday, the twenty first day of May, 1879, an assessment (No. 38) of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary at the office of the Company, Room 8 No. 402 Front street San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Tuesday, the first day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eleventh day of August, 1879, to pay the delinquent assessment, together with cost of advertising and expens of sale. By order of the Board of Trustees. W. D. WILSON, Secretary.

Office, Room 8, No. 402 Front street, San Francisco, Cal.

Numa Mining Company.—Principal Place of business, San Francisco, California. Location of works, Humboldt County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of June, 1879, an assessment (No. 1) of Three Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 324 Montgomery St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 11th day of August, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.

Office, 328 Montgomery St., Room 21, San Francisco, Cal.

Amusements.

CALIFORNIA THEATER.

Barton & Lawlor.....Manager.
Barton Hill.....Acting Manager.

LESTER WALLACK.

Bush Street, above Kearny. Open every evening. Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance.

BUSH STREET THEATER.

Chas. E. Locke.....Lessee and Manager

JOSHUA WHITCOMB.

Open every evening and Saturday Matinee.

BALDWIN'S THEATER.

Thomas Maguire.....Manager.
F. Lyster.....Acting Manager.
Chas. H. Goodwin.....Treasuror.
J. P. Chapman.....Assistant Treasurer.

Miss Rose Coghlan, Miss Nina Varian and the Regular Company.

Corner Market and Powell Streets. Open every evening and Saturday matinee. Box office open daily.

Books for Miners and Millmen.

Kustel's Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

Kustel's Concentration of Ores (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

Phillips' Explorers, Miners and Metallurgists Companion, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 672 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10 50 Sold by Dewey & Co., S. F.

Aaron's Testing and Working Silver Ores.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

Copp's Handbook of Mining Laws.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to Edward Frisbie, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

The Greatest Invention of the Age!

MACKINNON PEN.

THE NEW WRITING INSTRUMENT.

24 Geary St., San Francisco.

A. S. HALLIDIE.

Office, No. 6 California Street,
SAN FRANCISCO.

Manufacturer and dealer in all kinds of

Iron and Steel Wire Rope,

Flat and Round, for Mining, Shipping, Hoisting and General Purposes.

Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.

Iron, Steel and Galvanized Wire
Of all sizes on hand or made to order.

Barbed Fence Wire.

Sole Proprietor of
Hallidie's Endless Ropeway,
For the Transportation of Ores, Etc.

Send for a Circular.

A. S. HALLIDIE,
Office, No. 6 California St., San Francisco

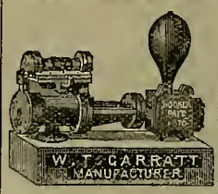
W. T. GARRATT'S
BRASS and BELL FOUNDRY

SAN FRANCISCO.

MANUFACTURER AND IMPORTER OF

Church and Steamboat BELLS and GONGS
BRASS CASTINGS of all kinds,
WATER GATES, GAS GATES,
FIRE HYDRANTS,
DOCK HYDRANTS,
GARDEN HYDRANTS

General Assortment of Engineers' Findings.



Hooker's Patent Celebrated

STEAM PUMP

The Best and Most Durable in use. Also, a variety of other

PUMPS

For Mining and Farming Purposes.

ROOT'S BLAST BLOWERS,

For Ventilating Mines and for Smelting Works.

HYDRAULIC PIPES AND NOZZLES,

For Mining Purposes.

Garratt's Improved Journal Metal.

IMPORTER OF

IRON PIPE AND MALLEABLE IRON FITTINGS.

ALL KINDS OF

WORK AND COMPOSITION NAILS,

AT LOWEST RATES.

A CARD.

To Parties Interested in Mining and Milling.

Call at J. HENDY'S, N. E. corner of Mission and Fremont Streets, San Francisco, and examine COLEMAN'S PATENT SLUICE. It will save both float and flour Gold. The best system yet devieed. No power required to work it. Examine it and judge for yourcelves before purchasing elcewhere.

CARROLTON
Writing Papers

Notes, Letters, Legals and Foolscaps, all weights. The best Cheap Paper in the World.

H. S. CROCKER & CO.

Some fine sunny offices (next to the Press office), to rent (at very reasonable rates), by Dewey & Co., at 202 Sansome street, corner of Pine.

507 Mechanical Movements.

Every mechanic Should have a copy of Brown's 507 Mechanical Movements, illustrated and described. Inventors, model makers and amateur mechanics and studente, will find the work valuable far beyond ite cost. Sold by Dewey & Co., Patent Agents and publishers of Mining and Scientific Press, San Francisco. Price, $1, (post paid.

Iron and Machine Works.

THOS. PENDEROAST. HENRY S. SMITH.

ÆTNA IRON WORKS,

MANUFACTURERS OF

IRON CASTINGS and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom,

SAN FRANCISCO.

SACRAMENTO BOILER WORKS,

214 & 216 BEALE St., (rear of Ætna Foundry)

J. V. HALL,

PRACTICAL BOILER MAKER,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS AND ALL Kinds of Machinery for Mining Purposes.

Flouring Mills', Saw Mills' and Quartz Mills' Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets,

SACRAMENTO, CAL.

PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.

HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 and 17 Drumm St., near California,

SAN FRANCISCO, CAL.

Golden State & Miners Iron Works,

Manufacture Iron Castinge and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Foleom, S. F.

WM. H. BIRCH. JOHN ARGALL.

California Machine Works,

BIRCH, ARGALL & CO.,

119 Beale Street, San Francisco.

☞General Mechanical Engineers and Machinists. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturers of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

California Brass Foundry,

No. 125 First Street, Opposite Minna.

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hoso Couplings and Connections of all sizes and patterns, furnished with dispatch. ☞PRICES MODERATE.☜

J. H. WEED. V. KINGWELL.

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON. THORNTON THOMPSON.

THOMPSON BROTHERS, EUREKA FOUNDRY,

129 and 131 Beale St., between Mission and Howard, S. F

William Hawkins,

(SUCCESSOR TO HAWKINS & CANTRELL).

MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturer of

IMPROVED PORTABLE HOISTING ENGINES,

FOR MINING AND OTHER PURPOSES.

Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.

Steam Engines and all Kinds of Mill and Mining Machinery.

Pacific Rolling Mill Co.,

SAN FRANCISCO, CAL.

MANUFACTURERS OF

RAILROAD AND MERCHANT IRON,

ROLLED BEAMS, ANGLE, CHANNEL AND T IRON, BRIDGE AND MACHINE BOLTS, LAG SCREWS, NUTS WASHERS, ETC., STEAMBOAT SHAFTS, CRANKS, PISTONS, CONNECTING RODS, ETC., ETC.

Car and Locomotive Axles and Frames, and Hammered Iron of Every Description.

HIGHEST PRICE PAID FOR SCRAP IRON.

☞ Orders Solicited and Promptly Executed. Office, No. 16 FIRST STREET.

Fulton Iron Works.

Hinckley, Spiers & Hayes.

(ESTABLISHED IN 1855.)

Works, Fremont and Howard Sts. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERT. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERI, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

Western Iron Works,

316 and 318 Mission Street, San Francisco,

PERRY EDWARDS, Prop'r.

Manufacturer of Wrought Iron Girders, Trusses, Prison Cells, Iron Roofs, Crest Railings, Finials, Fences, Weathervanes, Gratings, Iron Work for Models, Etc.

Nickel Plated Railings. Bank and Store Fittings. Estimates given and Iron Work furnished for Buildings.

Dewey & Co. { 202 Sansome St } **Patent Ag'ts.** | *Engraving done at this office.*

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

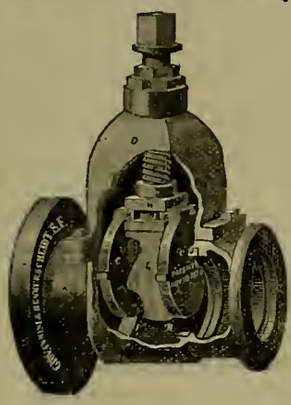
Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

GIOVANNINI & CO., 417 & 419 Mission St, S. F.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

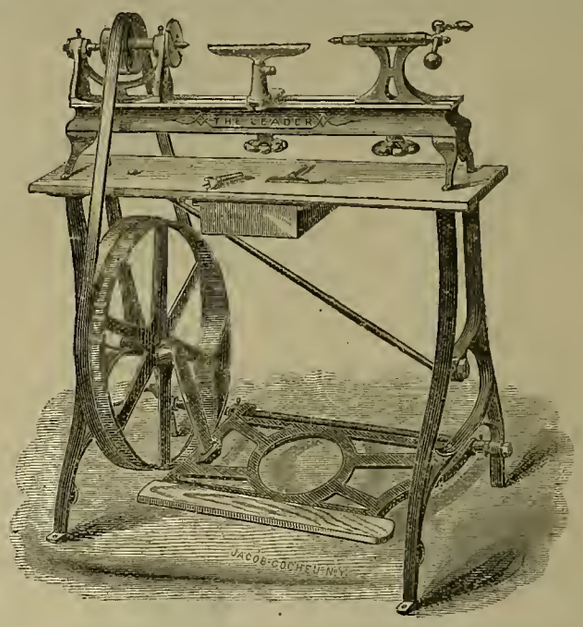
Lathe Without Saw Attachments.



This lathe has been made especially to meet a want felt by many for a really good and substantially made Foot-Lathe at a reasonable price, and we think that we can safely say that it will be found to be the best Lathe ever placed on the market at the price asked. The bed, head, and tail stocks are of iron; the spindles of steel. The bearing of the head stock is conical, so that the wear can be easily taken up.

Material eighteen inches long and eight inches in diameter can be turned upon it. The pieces that accompany this Lathe without extra charge are two rests, two plain centers, one spur center for wood turning, and one face plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe WITH SCROLL Saw Attachment.....$55.
Price of Lathe with both Scroll and Circular Saws, $70.

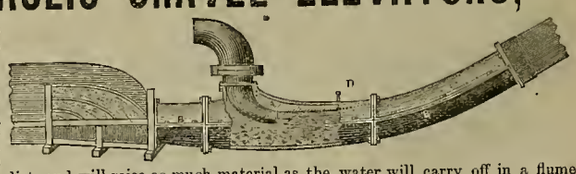
Trump Drill Chuck.

Chuck for drills ½ and under, Price.....$1.50
Chuck, for drills ¼ and under, Price.....$2.25

They are made on solid steel plug, centered and *readily fitted to Lathe or Drill Press.*

SEND FOR CIRCULAR.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, JUNE 28, 1879. VOLUME XXXVIII Number 26.

Earthquakes.—No. 1.

The late eruption of Mount Etna, the present disturbed condition of Vesuvius, and the quite recent earth tremors perceived on our coast, afford an occasion for calling attention to the subject of earthquakes and their explanation, effects, etc.

It has been through the labors of Robert Mallet, of England, that this subject has assumed a scientific shape, and its importance, with a view to avoid the direful effects of Nature's throes, cannot be over-estimated in this utilitarian age.

The great complexity of earthquake phenomena, and their secret origin deep within the bowels of the earth, have produced during all ages so much surprise and alarm, that the human mind has been unfitted for scientific observations. Until twenty years ago the state of knowledge on this subject was much the same as it was 2,000 years ago. Yet, in the short period of twenty years, our knowledge of earthquakes is even greater than that of volcanoes.

Mallet has collected the records of 6,830 earthquakes as occurring in 3,456 years previous to 1850, but of that number 3,240 occurred in the last fifty years; not because they are becoming more numerous, but because the records are more perfect. Taking the last four years of Mallet's record, the number of earthquakes was about two a week. Alexis Perry, in a more complete record from 1843 to 1872, inclusive, mentions 17,249 or 575 per annum. It would seem probable, that as the larger number of earthquakes are not even now recorded, because they occur in mid ocean or uncivilized regions, the earth is *constantly quaking* in some portion of its surface.

It cannot be doubted that a close connection exists between earthquakes and volcanoes. Explosive volcanic eruptions are always preceded and accompanied by earthquakes, and earthquake shocks which have continued to trouble a particular region for a long time, suddenly cease when an outburst occurs in a neighboring volcano, showing that the latter are safety-vents for the interior forces which produce earthquakes.

According to the present well-sustained theory of the molten or plastic condition of our inner earth, and the consequent supernatant condition of the earth's crust, earthquakes are intimately connected with the bodily movements of great areas of the earth's crust, by elevation or depression, and hence it happens that earthquakes occur with great violence in regions very remote from volcanoes. It should always be born in mind that volcanoes are not the causes of earthquakes, but that a volcano may be created by an earthquake. In order to simplify the idea sought to be impressed upon the mind, we have only to imagine that the earth's crust is not a continuous mass in which there is no break, but it is a broken up and irregular crust of inorganic matter, supported by and subject to the movements of the igneous, molten matter upon which it floats. We could give many instances of regions being depressed or elevated, but we refer only to the mountain in Georgia, which is now gradually sinking. In fact, the crust of the earth is in continual movement by elevation or depression almost everywhere. Partaking on a large scale of the same motion perceived in a ship on the ocean swayed by the constant swell of the waves, this motion is the *remote* cause of earthquakes, while the proximate cause of the observed effects of the earthquake is the arrival of a shock or earth-jar, a sudden interference, as it were, with the oscillation of the earth's crust.

To more clearly illustrate our meaning, we are compelled to allude to some of the principles concerning waves. As to their propagation, waves are either of gravity or of elasticity; as to direction, they are either transverse or longitudinal; and as to form, may be regarded as circular or spherical.

Gravity and circular waves are always of transverse vibration; spherical waves are of longitudinal vibration, while waves of elasticity are either longitudinal or transverse. It is, however, principally of elastic longitudinal waves that we shall speak, and state as a principle that all waves propagated from a point within a medium such as sound waves, are elastic spherical waves of longitudinal oscillation. The sense in which they are used is illustrated in Fig. 1. The bar, *A, B*, represents a prism cut from a vibrating sphere in the direction of the radius, and the light and dark portions represent condensation and rarefaction. Now, on the line *a, b*, representing the natural state of the bar, draw ordinates *above* to represent the degrees of compression, and below to represent degrees of rarefaction; then the undulating line will correctly represent the state of the bar during the transmission of elastic longitudinal waves. The compressed portions are called crests, and the most rarefied troughs as in transverse waves, such as ocean waves. From crest to crest is the length, and the amount of oscillation of the particles back and forth in compression and rarefaction is the hight of the wave. The *velocity* of *water-waves* depends wholly upon the *wave-length*, while the velocity of *elastic* or earthquake waves depends wholly upon the *elasticity of the medium*. Thus the harmony of a full hand of music is perfect even at a great distance, because all the sounds whether loud or soft run with the same velocity, and the only difference in earth-waves is that when the medium is not uniformly elastic, and the waves or vibrations are high, the medium is *broken* by the passage of the waves, elasticity is diminished, and the waves *retarded*.

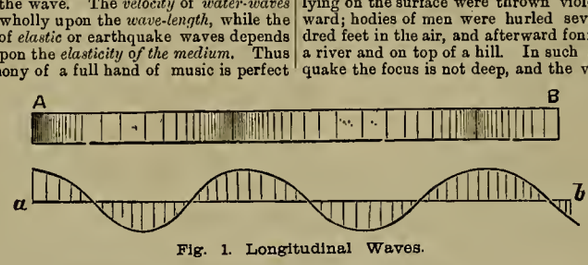

Fig. 1. Longitudinal Waves.

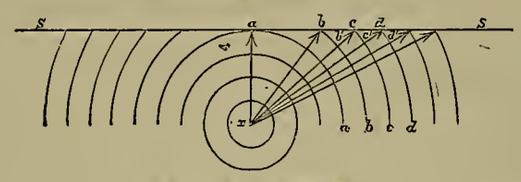

Fig. 2. Surface Waves.

Fig. 3. Reflected Waves.

Fig. 4. Wave Outcrop.

THEORY OF EARTHQUAKE WAVES ILLUSTRATED.

Let us suppose a concussion or explosion of any kind to occur at a considerable depth (*x*, Fig. 2), say 20 miles beneath the earth-surface, *S, S*, a series of elastic spherical waves will be generated, expanding with great rapidity in all directions until they reach the surface at *a*. From this point of first emergence the still enlarging waves would outcrop in rapidly expanding waves, which we call the *surface-waves*, as shown in Fig. 2 at *a, b, c, d*, etc. This surface-wave would not be a normal wave. It would be only the outcropping or emergence of the ever-wideuing spherical-wave on the earth-surface. Both its velocity of transit along the surface, and the direction of its vibration in relation to the surface, will vary constantly.

It will be readily understood that the earth-waves do not cease at the surface, but continue through the lighter medium, the air which surrounds and is a part of the earth. They may, and it is probable that they do continue to the outer limit of the atmosphere until they again meet and become infinity. We know their action up to and at the point of emergence at the earth's surface, beyond that, is debatable, experimental ground. Mallet determined experimentally the velocity of elastic earth-waves by exploding a barrel of gunpowder buried in the earth at a known distance, and noting the difference between the instant of explosion and the arrival of the earth tremor, and it was also observed in the Hell Gate explosion in New York harbor. In sand the velocity was found to be 825 feet; in slate, 1,225 feet, and in granite 1,665 feet per second or 19 miles per minute.

As to their effects, earthquakes are generally divided into three kinds, viz: the explosive, the horizontally progressive and the vorticose. In the first a violent motion directly upward breaks up the earth crust, and bodies on the surface are thrown high in the air. The shock is violent but does not extend to any great distance. It was an earthquake of this kind which destroyed Riobamba in 1797. The shock came suddenly, like the explosion of a mine, the earth was broken up and rent asunder, and objects lying on the surface were thrown violently upward; bodies of men were hurled several hundred feet in the air, and afterward found across a river and on top of a hill. In such an earthquake the focus is not deep, and the velocity of the wave or shock is not impeded before it emerges.

The *vorticose* earthquake causes a whirling motion of the earth, entirely different from ordinary wave-motion, the three kinds, although seemingly essentially distinct and possibly produced by different causes, only differ from each other on account of the different conditions under which the waves emerge on the surface. The causes are the same but the variations of the medium produce variable results as to visible characteristics.

The *horizontally progressive* may be regarded as the true type of an earthquake, and is the spreading surface wave delineated in Fig. 2, at *a, b, c, d*, etc. These quakes usually run along mountain chains, which generally consist of a granite axis, flanked on each side with stratified rocks of many different kinds. When elastic waves pass from one medium to another of elasticity, a part of the waves passes through, but a part is always reflected. For every layer a reflection occurs; and hence, if there are many such layers, the waves are quickly quenched. In Fig. 3, which represents a transverse section across such a mountain, and *X* the focus of an earthquake, it is evident that only that portion of the spherical wave which emerged along the axis, *a*, would reach the surface successfully; while those portions which struck against the strata of the flanks would be partially or wholly quenched. The mode of outcrop on the surface is shown in the map-view, Fig. 4, in which *a* is the point of emergence or spectrum, *b, c*, the granite axis, and *c, c*, the stratified flanks.

The velocity of surface waves is about 20 miles a minute, although some have been recorded as high as 30 to 35 miles per minute, and in some slight shocks occuring in New England, several years ago, the velocity as determined by telegraph, was estimated as high as 140 miles per minute. The amazing difference being caused by the fact that heavy shocks (large and high waves) break the medium, and are retarded as has been said, while slight tremors (small and low waves) are successfully transmitted without rupture, and therefore run with the natural velocity belonging to the medium, *i. e.*, the velocity of sound, which in granite is about 140 miles per minute.

This interesting subject, the illustrations for which are selected from Le Conte's "Elements of Geology, published by D. Appleton & Co., N. Y., will be continued in another article.

Close of the Volume.

This number closes Volume XXXVIII. of the MINING AND SCIENTIFIC PRESS. The practical results are in the main manifested in the index on the last page. We have not confined ourselves exclusively to mining matters, but have devoted much care and attention to the manufacturing and general scientific interests of this coast. Whatever has been of value to our mining and mechanical interests we have procured and inserted in our columns, drawing, therefore, upon the best scientific publications of the world, and from special sources of information. Particularly we have been desirous of furnishing information of value to our industrial classes. Our aim is still higher, and we are determined not to leave any means untried to develop our resources and awaken a justifiable pride in all of our institutions, whether for their improvement or amendment, or for the adoption and introduction of new features. As a new volume will commence with the next number, we regard it as a favorable opportunity for subscribers to send in their names, and for old subscribers to renew their interest in a publication devoted to the industrial progress of this coast. New and valuable matter will appear in every issue, and we shall not spare any effort to make our journal a necessity to all of our industries. The period of depression through which we are passing has, we believe, reached its climax, and more favorable times will soon enable us to press onward to the future goal which awaits us in the development of our resources, so recently begun.

THE "JEANNETTE." — Bennett's exploring steamer *Jeannette*, after making a satisfactory trial trip at Vallejo, is now at the wharf in this city. On next Tuesday she will start on her perilous voyage to the Polar sea, escorted as far as Onnalaska by the U. S. steamer *Alaska*, and escorted to sea by the entire fleet of the San Francisco Yacht Club as a mark of respect to Mr. Bennett and Captain De Long, who are both members of the New York Yacht Club. It will be remembered by our readers that the projector of this the first Polar expedition from this coast is James Gordon Bennett, of the New York *Herald*, who purchased and fitted out the vessel at his own expense, and will hear all the expenses of the voyage. Mr. Bennett turned the vessel over to the United States Government, and it was placed in charge of Lieutenant G. W. De Long, of the Navy, who brought her to San Francisco via the Straits of Magellan. Since her arrival here she has been strengthened at every point to endure the perils of an Arctic voyage, her engine overhauled and extra care and attention devoted to its perfection. Mr. Bennett has not spared any expense to make the vessel the most complete in strength and outfit. In fact, no exploring expedition ever started under more favorable auspices, and it remains to be seen, as it is hoped, whether success will attend the efforts of private capital to reach the North Pole by way of the Golden Gate.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Fish Farming.

EDITORS PRESS:—I am very much interested in the culture of fish, and appeal to you for information regarding it. Is it too late in the year to obtain young fish? What kind would thrive best in a pond having a constant supply of fresh water? From whom could I get them, and at what cost? By answering the above you will confer a great favor.—E. A. BRALY, Santa Clara, Cal.

There is no farm having a spring, brook or slough upon it, or even having a windmill pumping water, that cannot be made to yield a supply of good food fish for the use of a family and a surplus for sale. There are many farms in this State where fish are cultivated. Mr. Davis, at Brighton, in Sacramento county, on the high, dry plains, is largely in the cultivation of fruit and berries which are irrigated by windmills. He has thrown up an embankment about a couple of acres, and the surplus water pumped by his windmills runs into the pond thus made. This pond is about three feet deep. He procured a few fish from the Sacramento river, two years since, and now estimates that he has of old and young more than one hundred thousand fish. The late Mark Hopkins procured a few Sacramento River perch and nine catfish, five years since, and placed them in a slough on his farm in Sutter county. This slough now contains myriads and supplies not only the inhabitants of the farm but all of the people in the vicinity. Mr. Felts, of San Mateo county, has a farm in the hills of that county and constructed a reservoir for irrigation and for the use of his house and barns. He placed in the reservoir trout, salmon and land-locked salmon. It is becoming fully stocked, and in another year could be made a source of revenue. Mr. Clippinger, the railroad agent at Brighton, uses as a pond about half an acre of an excavation from which the earth was dug for the railroad embankment. A windmill supplies this with water. From a few dozen catfish placed in this pond last winter he estimates that he now has more than five thousand. Francis Francis, Seth Green, Livingston Stone, Fred Mather and other writers on fish culture have proven that an acre of water cultivated to fish will yield four times the profit that can be obtained from an acre of land. The water requires planting but once, the crop cares for itself and has neither to be housed nor fed. The State Fish Commissioners inform us that many farmers have written them and obtained instructions, and are stocking their waters with appropriate fish. They state that the interest in local fish culture is much more extended among farmers than we had supposed.

To answer Mr. Braly's questions, almost all water is suitable for some kind of food fish. But to answer what kind of fish should be placed in a given piece of water it is necessary to know, first: Is the water moderately pure? What is the highest temperature in summer? Is its bottom rocky, muddy or sandy? If, as we suppose, your pond is on the level land at Santa Clara, with a mud bottom, then the best fish would be carp, which you can obtain from A. J. Poppe, Santa Rosa, or Levi Davis, Forestville, Sonoma county, and Schuylkill catfish and Sacramento perch, which you can obtain from Henry Pither, Sacramento. A letter to one of the State Fish Commissioners, describing your pond, temperature of its water, source of supply, etc., with a request for information as to the most appropriate fish and where they can be obtained, will, we have no doubt, be promptly answered.

Letter from Mariposa County.

EDITORS PRESS:—Mining matters in this county have again assumed a lively and hopeful aspect. The active operations now being pursued by Joshua Hendy, of your city, who is the owner of the Bonderetta mine, has encouraged others to make fresh and early exertions to develop the numerous rich locations that center within a radius of 20 miles from this attractive and growing town.

The Bonderetta mine is indeed fast proving a literal bonanza to its present owner. With the new ten-stamp mill recently erected by Mr. Hendy, the net profit per day approximates closely $250, and when the tunnel now being run is carried some 900 feet further into the mountain, it will present a face of ore about 1,500 feet in length, conferring upon this property a value verging upon a quarter of a million dollars. Should the ore continue to increase in richness as it promises to do, its value may reasonably be estimated at a still higher figure.

A great deal can truthfully be said in favor of the Bondurant mines, comprising three locations, each possessing an area of 1,500 by 600 feet, all located on a well-defined and continuous lode. These mines are distant one and one-half miles from the Bonderetta mine and ten from the town of Coulterville. Recently these mines have come under the management of San Francisco, New York and Boston parties, who have incorporated under the name of the "Bondurant Gold and Silver Mining and Reduction Company." The property of the company consists of the three locations mentioned, and known respectively as the Sugar Pine, Bondurant and Bondurant Extension.

There is connected with the property a good eight-stamp mill with Hendy's concentrators attached, operated by a twenty horse-power steam engine; also hoarding-house, lodging-houses, blacksmith shop, stable, etc.

The developments made here consist of the following: A tunnel has been run on the Sugar Pine location, commencing some two hundred feet below the crown of the hill, and extending along the vein some three hundred feet, being all the way in good paying ore, from three to four feet in width the entire distance. From this tunnel continuing down in the pay chute, "A" "B" and "C" have been sunk. They are situated 100, 200 and 300 feet from mouth of tunnel, and have reached the depth of 40, 60 and 75 feet respectively. These shafts have produced rich rock and sufficiently developed the lode to demonstrate its permanent character and establish that if properly worked it cannot fail to yield large profits.

It is the intention of the new owners to erect both reduction and hoisting works complete the tramway from tunnel to mill, and sink a shaft from the crown of the hill to intersect the tunnel and "C" shaft.

The future of this company is flattering and the time not distant when they may reasonably expect to reap a liberal return for the money they have here expended.

No section of the State affords better inducements for engaging in quartz mining than Mariposa county. The ledges here are well defined, large and permanent, and wherever worked with system and care have yielded good profits.

In the vicinity of the Bondurant property are located the following mines, viz., the Martio & Walling, the Hasloe, Cook, Brothers, Washington, Princess, Ferguson, Coulterville, Eureka, Merced, Allen, Champion, Last Chance, McAlpin and the extensive property of the Pino Blanco Mining Association.

Some eight miles distant is situated the estate of the Mariposa Land and Mining Company, the Hite mine, noted for its large and profitable production of bullion, and its present splendid prospects, being distant about seven miles. From this it will be seen that the Bondurant lies in an excellent neighborhood.

With the promise of fresh capital matters look exceedingly favorable for this vicinity, and in my next communication I will submit additional details that will serve to acquaint the public with the superior facilities presented by this district for those desirous of engaging in legitimate mining enterprises.

BERWICK.

Coulterville, June 20th, 1879.

Utah Mineral Wax.

Mr. M. V. Ashbrook writes to the Salt Lake *Tribune* as follows concerning the great paraffine fields of that region: The mines are situated in Utah and San Pete counties, west of the Pleasant Valley coal fields. Arriving at the mines, I found such a formation and contour of country as is usually found in countries where coal is abundant and precious metals are wanting. Immediately above the paraffine mines I found an extensive bed of slaty shale or rock, strongly impregnated with petroleum. This bed of shale is 30 or 40 feet thick, and the stratum can be traced for miles. The shale is of some value for the oils contained in it. Below the shale is a belt or stratum of very soft friable sandstone of from 7 to 12 feet in thickness. In this belt of sandstone the mineral wax is found. The surface does not show a continuous vein like silver ores running parallel with the stratum of the rock, or in the general direction of the mineral belt. While the sandstone runs parallel with the shale stratum the paraffine is found in small veinlets cropping the sand stratum. The sand stratum is divided in sections and in the interstices of these sections the wax is found. There is also found in the wax veinlets a peculiar and very soft clay. The width of the wax in these outcroppings varies in different seams from one to seven inches. In some instances the clay in the interstices displaces the wax, at other places the wax compresses or presses aside the clay and occupies the space between the harder rocks.

Below the sandstone there is a soft slaty rock which breaks in blocks when removed, and seems to be the banging wall to the belt of mineral. The outcroppings so far as discovered have been located. Little work has been done to determine what is in the depths below. In no place did I see a hole beyond the depth of eight feet. The extent of wax can only be determined by development. From the surface indications, I judge that there is an extensive deposit of this paraffine and that as depth is attained the veinlets will consolidate into a large body or deposit. The formation, and more especially the impregnation of rocks and soil, leads me to this conclusion. As to the uses the arts and sciences will make of this wax, though it be in abundance, I am little informed. It will be, if not now, a useful and merchantable article, but, I opine, echo is asking when? The indications are good and petroleum will be found in the wax country. That article has been utilized.

THE Old Colony railroad, of Massachusetts, is having several cars built, in which the windows are made to swing outward like a pair of double doors, hinged upon a narrow upright rod, running perpendicularly, in the center of the window aperture. The object is to give passengers fresh air without an admixture of cinders.

The Good Time Coming.

[Written for the MINING AND SCIENTIFIC PRESS by ALMARIN B. PAUL.]

At no time since the opening of the Comstock, which electrified the world with its wonderful production, has there been such a brilliant outlook as is now looming up for our mining industry. On every hand there is awakening a renewed spirit of enterprise, industry and hope. Eastern as well as home capital is on the move through our mountain ranges, seeking investment. Old claims are being re-staked, re-opened and made to develop their worth. Our mountains are beginning to reverberate with the echoes of the working of new machinery, and the faces of our old miners smile with the cheer of the coming golden era.

Not only is renewed interest awakening in California, but all over the Eastern and Western States is growing a spirit for mining ventures. And is it strange that it should be so, when our mines have made more millions than any other pursuit, and built so many palaces of beauty and blocks of such substantial wealth. New York, Chicago and St. Louis are beginning to pour out their surplus millions, and soon we will see these great cities the peer of San Francisco in their mining operations. That San Francisco embodies all the dash, enterprise, wealth and pluck for mining ventures, is only to be harbored in minds of limited experience.

Well does your humble servant remember the opening of Lake Superior, and the mining fever of that time, and how New York, Boston, in fact, how the East and the West poured forth their millions of money, and men of skill, enterprise and worth. Again, we all know how it was on the opening of California.

We may look at our palaces and substantial blocks, built by successful mining ventures, but let us look also to the great coal and iron interest of Pennsylvania. It is not for us on this coast to underrate, but to appreciate and draw by our best endeavors this capital, tact and enterprise, for without it we may loose much. California and Nevada are having formidable rivals for this wealth and enterprise in Colorado and New Mexico, to say nothing of Virginia, North and South Carolina. What has awakened this the present new spirit for mining East, is not only our vast production, but the fact of such rich discoveries as those of Leadville, Colorado, which, in silver, is expected, and bids fair to rival the Comstock in its production, as well as the gold discoveries in the various sections of the great mineral belt extending southward.

California and Nevada have a great record for mineral productions, which is a guarantee for the future, and, as full security for mining capital, which endeavors to move where there is the surest backing (independent of the well-known sections of our State), our new mining regions in the main belt of the Sierra Nevada promise much. I mean all that section of country off of Bodie and extending southward the whole line of the Nevada to Walker's pass—a chain over 200 miles in length. And I unhesitatingly predict that this vast belt, whose peaks tower from 8,000 to 12,000 feet in hight, will, in less than a quarter of a century, be the seat of such stupendous mining works that nothing of our present will be the equal. This chain of mountains possesses, with its mineral lodes of great proportions, advantages for wood and water, and in localities water for power, capable of running 500 stamps and, in the coming future, mills of 100 stamps each will be the rule and not the exception, as now. Tioga, Prescott and Lake districts are but the beginning of this vast undeveloped mineral field. Not only are there advantages of wood and water, but facilities for mining are excellent. The Mammoth, of Lake, with a tunnel 700 feet in length, gives 1,000 feet of "backe" on the lode. As to quality of ore, it is sufficient to say it "is pay." The same may be said of the True Blue, and others. Then again, in the ranges lying first to the east, but in the State of Nevada and extending southward to the borders of Arizona, is a vast region of silver wealth, with lodes of great proportions and richness, but which, for the lack of capital, have laid for all these years untouched.

It is in these sections of California and Nevada "rich discoveries" will be heralded every little while, and there will be merit in the reports. Twelve years ago I explored much of this whole region for hundreds of miles north and south, and know whereof I speak. That there is a good time coming, I argue from two standpoints, first that surplus capital from the East and West is going into mining, it cannot be satisfied with four per cent. per annum; there is too little in that to satisfy the restless spirit and greed of Americans, and what industry promises the return of mining with caution, experience, and its accumulated advantages. As the New York *Herald* once observed, what industry could stand the same expense of mining with its rates of labor. It would have ruined every other pursuit.

I argue it further from the fact that our skill is now great; our experience more complete, as well as the vast strides in mechanical devices, and wherehy tunnels are driven by steam or water power, instead of by hand.

The powerful yet cheap explosives which are made often to uplift whole hills at a single blast, while "giants" melt and wash off the auriferous earth as snow banks before a scorching sun. Not only this, but while too many still cling to a wasteful system of milling our ores, there are improvements in every class of milling machinery, and which, at less expense than formerly, returns a much higher per cent. From all this, to say nothing of the reduction in the price of labor, I argue a good time coming.

As to our new Constitution, and the assured favorable legislation in favor of mining, there will be given a guarantee for mining capital to a degree which it never yet has had on this coast.

The people have grappled with the corruption of the past and conquered, and while there will be strong opposition to villainous speculative measures, there will be care to foster honest mining, and to throw guards around both home and foreign capital for its better security.

From all these points I argue a great mining revival, and that capital will not only soon be plentiful, but that it will be rewarded, if only moderate care is exercised; and it should be the desire of all to make every foreign investment remunerative, that we may not, as in times past, by rascally deception, kill the goose that lays the golden egg, for the incoming of foreign capital will enhance our prosperity and help to open the coming golden era.

San Francisco, June, 1879.

Cold Waves and Their Causes.

The climate of the United States, especially the eastern portions of it, is subject to great and rapid changes. These are caused, in many instances, by the large extent of surface over which its territory extends, and the difference in the amount of solar heat received in different parts. When large bodies of snow have been deposited in the north, the wind sweeping over them is deprived of its heat, and a lower temperature is the result. When winds from more southerly latitudes occur, the reverse takes place. The vicinity of the large oceans which margin the continent of North America on the east and west also tend to produce a change, water parting with its heat less readily than the land. In addition to these the current of warm water thrown along the east coast of the United States by the Gulf stream, and in the Pacific by the Sea of Japan, also exerts a powerful influence on the climate of the regions adjacent to the shores touched by them. In the great valley of the Mississippi the cold wave usually has its origin in the ice and snow-covered countries directly north, and periods of drouth by winds from the south.

In European countries the cultivation of the soil and the removal of timber have produced important climatic changes, and the same has been noticed in the United States. Our winters have not so much severe weather as occurred in the early settlement of the continent, but it takes place more suddenly and to a greater extent. This is easily accounted for, as the surface of the country, when denuded of timber, presents less obstruction to the advance of storms, and also affords a greater diversity of exposure in its surface to the rays of the sun, and becomes more readily and differently heated. As is well known, wind is nothing more than air rushing in to restore the equilibrium which has been disturbed by expansion caused by heat, and when the air thus moving is loaded with snow or other vapor, this, when meeting with air of a different temperature, condensation takes place and rain or snow is deposited.

The influence of these sudden changes on health is a subject for the investigation of medical men and philanthropists. That it has much to do in causing physical infirmities can not admit of a doubt. A change of 40 degrees of temperature, such as occurred on January 2d, must aggravate all diseases of the pulmonary organs, and hence, perhaps, the extent and fatal effects of consumption in the Eastern and many of the Western States.

Countries in which the temperature is nearest uniform, whether it be high or low, are generally least afflicted by diseases which arise from exposure to the extremes of heat and cold; while almost every portion of the habitable globe is subject to visitations from maladies which produce disease and death. These generally arise from local causes, such as stagnant water and large quantities of animal and vegetable matter undergoing decomposition.

They do not extend to large areas, and instances of longevity in such countries are not uncommon. The lengthening day and the restoration to a state of rest of the disturbed atmosphere will cause the cold waves to be in a manner temporary; but so long as large bodies of ice and snow are spread over the Great Lakes and large portions of the North and West, the recurrence of these waves of cold may be expected to prevail.—*The Meteorologist.*

COOLING HOT JOURNALS.—Von Heeren proposes a method of cooling hot journals by a mixture of sulphur and oil or grease. The fine metal dust formed when a journal runs hot, and which strongly acts upon both journal and bearing, forms a sulphide of sulphur. This compound, which grows soft and greasy, does not cause any appreciable amount of friction. It has been very successfully used by the steamers of the North German Lloyds.

BLACK POLISH ON IRON AND STEEL.—To obtain that beautiful deep black polish on iron or steel which is so much sought after, it is required to boil one part of sulphur in ten parts of oil of turpentine, the product of which is a brown sulphuric oil of disagreeable smell. This should be put on the outside as slightly as possible, and heated over a spirit lamp till the required black polish is obtained.

MECHANICAL PROGRESS.

The Austrian System of Milling.

[From Prof. Kick's new work on Milling.]

High milling—or, as it is also called, Vienna, Austrian, Hungarian, Prague, or Saxony milling—is that method of grinding wheat which, by a gradual reduction of the grains of wheat, aims at producing the largest quantity of middlings, which, being cleaned, reground, and again cleaned, etc., and consequently gradually reduced, is finally manufactured into flour. This system of grinding, which originated in Vienna, produces the most beautiful and the whitest, and generally the finest kinds of flour, in proportionately larger quantities. In the Austrian system of grinding, the stones are placed at such a distance from each other that the first time the grain passes through them it is only slightly rubbed and broken. In this operation the beard and parts of the cuticle would be rubbed off, if this was not done before by the hulling machine. This operation is called ending, (Spitzen), or, in case the stones grind more coarsely (Hochschroten), inasmuch as in this coarse grinding the grain is broken along the entire length of the furrows, so that the produce therefrom is mixed with flour, branny particles, and germ that have been scraped off. The products are separated by sieves, and the result is dark flour, poor bran, and coarse middlings. The latter product is passed through stones placed more closely together, and is subjected to the first grinding, that is to say, it is further broken, and we obtain particles varying in size, flour, *dunst* (which is analogous to flour), middlings, and a still coarser commodity called *schrot*. After this product has passed through the sieves, the different sorts are graded according to their size, consequently all those branny particles, which are of equal fineness with the flour mingle with the flour, and those of the same size as the so-called *dunst*, with the *dunst*, etc. It is scarcely possible to separate from the flour the equally fine branny particles; this is done, however, as far as the middlings and dunst are concerned, by means of middlings purifiers.

The question now is, of which parts of the grain of wheat does the several products consist? The flour obtained from the first grinding (Schroten) will be better, in other words, will contain fewer branny particles than that obtained by the operation *hochschroten* above described, but it will nevertheless contain a great number, seeing that the stone exercises a breaking action upon the grain, and more or less reduces the cuticle.

Dunst and fine middlings are mostly composed of small fragments of the flour substances, and in the process of breaking fall from the inner as well as from the innermost part of the grain, and become polluted by the admixture of branny particles of equal fineness. If these are removed by the middlings purifier we obtain pure middlings, which in consequence of being derived from the innermost part of the grain, are called *core-middlings* (Kerngriese), or, because they are used for making the finest flours, Auszugmehle and Auszugriese.

The coarser middlings (Auflœsungen), and the still coarser *schrot*, are fragments which, the larger they are, the more certain are they to be overlaid with portions of the layer of gluten, of the skin of the germ and the grain, and are, consequently, of a much darker color than pure middlings. The coarse middlings and the coarser *schrot* are put through the purifying machine, in which they are gradually reduced. If during the preliminary grinding (Hochschroten) germs get loosened from the grain, they get knocked off especially during the first grinding, and arrive in proportion to their size, for the most part uninjured, among the coarse middlings, to which they impart, by their yellow color, a speckled, yellow appearance. The product of the preliminary grinding is separated, and the middlings and finer middlings purified.

It is exceedingly difficult, nay, even impossible, to give to non-practical men anything like a clear idea of the nature and appearance of the various milling products either by description or illustration. The only way in which he can become acquainted with them is by seeing them in a well conducted mill, where high milling is practiced.

The first rough grinding is followed by a second, the second by a third, and the third by a fourth, but the number of these is not in all mills alike. We must not imagine, however, that in these successive divisions or breaking up of the grain, that in the preliminary grinding (Hochschroten) the grain is broken in two, and by the first grinding (Schroten), it is broken into four pieces, etc., on the contrary, the division when the stones are rightly placed, is so managed that at each successive operation the several parts gradually loose their polyhedrous or spherical shape, and assume a lamelliferous form. In the first, second and third rough grindings, the greater part of the grain is consequently reduced to flour and middlings, and the material which undergoes fourth grinding has become so far triturated that no coarse middlings can be got from it, but only dust mixed with numerous particles of outer husk. Along with these we obtain flour as well as coarse and fine husks. There are scaly particles consisting of gluten, and the cuticle of the germ and the grain, to which a perceptible number of starch cells adhere. In many mills these scaly particles are called stripes, in fact those remaining after the fourth and fifth grinding, *white stripes;* and after once more grinding *black stripes*. The fine and coarse roughs are in many mills ground together, in others separately. The former go also by the name of *Haspan*. By ground roughs and ground *Haspan*, we understand those scaly parts, which, by their repeated passage through the stones, are freed from the particles of flour adhering to them, which serve as fodder for cattle and horses, and are distinguished by the general name of bran.

The Sand Blast.

Among the wonderful and useful inventions of the times is the common sand blast. Suppose you desire to letter a piece of marble for a grave stone; you cover the stone with a sheet of wax no thicker than a wafer, then cut in the wax the name, date, etc., leaving the marble exposed. Now pass it under the blast and the wax will not be injured at all, but the sand will cut letters deep into the stone.

Or, if you desire raised letters, a flower or other emblem, cut the letters, flowers, etc., in wax and stick them upon the stone; then pass the stone under the blast and the sand will cut it away. Remove the wax and you will have the raised letters.

Take a piece of French plate glass, say two feet by six, and cover it with fine lace; pass it under the blast, and not a thread of the lace will be injured, but the sand will cut deep into the glass wherever it is not covered by the lace. Now remove the lace and you have every delicate and beautiful figure raised upon the glass.

In this way beautiful figures of all kinds are cut in glass, and at a small expense. The workmen can hold their hands under the blast without harm, even when it is rapidly cutting away the hardest glass, iron or stone, but they must look out for finger nails, for they will be whittled off right hastily.

If they put on steel thimbles to protect the nails, it will do little good, for the sand will soon whittle them away; but if they wrap a piece of soft cotton around them they are safe. You will at once see the philosophy of it. The sand whittles away and destroys any hard substance, even glass, but does not effect substances that are soft and yielding like wax, cotton or fine lace, or even the human hand.—*Exchange.*

A Use for Niagara Falls.—If we may believe Sir William Thompson, the famous complaint which was once expressed as to the waste of good water power at the Falls of Niagara is destined to be at last satisfied. Sir William, in his evidence before the Select Committee on Electric Lightning, proposes to light North America, or a good part of it, by means of electricity generated by dynamo-magnetic engines in the neighborhood of the falls. These engines would not only light the homes of New York and Philadelphia, but also turn their sewing machines and boil their kettles. This prospect was at first a little too much for the committee, and Dr. Playfair seems to have timidly suggested that the Falls of Niagara were a little out of the record. He evidently forgot that Great Britain, by means of Canada, has a certain proprietorship in those falls, and that we must not allow our friends of the States to monopolize the good gifts of science and Providence. Possibly the Atlantic cables might be utilized so as to make Niagara light London, and in that case amiable noblemen of the future will have other associations besides Britania's trident on the azure sea to couple in verse with the great cataract. There is an opening, too, for his enterprising Highness the Khedive to utilize about the only thing in Egypt he has not yet utilized—the falls of the Nile. It would not be surprising if some enterprising projector had already telegraphed for a concession of the second cataract after hearing Sir William's evidence. He is evidently an enthusiastic partisan of the new method of illumination, and no one can deny that his opinion is a weighty one.

Navisphere. — A new instrument, which promises to be of great service in navigation, has recently been described in the French Academy by M. Magnae. It is called the navisphere, and its use is to indicate in a few seconds, without calculation being required, the names of the stars that are above the horizon at a given moment, to show their altitudes and azimuths, to determine approximately the proper angle of course for going from one point to another by an arc of a great circle, and the distance between these points. The instrument has two parts—the first consisting of a celestial sphere, having stars of the first and second magnitudes marked on it. This sphere rests on a spherical zone, wherewith it can be placed in all possible positions. The second part (receiving the special name of metrosphere) comprises the system of the horizon, the meridian, and the vertical, represented by a circle, a semi-circle, and a quarter of a circle, of metal. The arc representing the meridian is fixed at right angles to the (horizontal) circle of the horizon, joining the latter at zero and 180°. Its own zero is in the middle, and represents the zenith, thence it is graduated to 90° on either side. One end of the quarter-circle, representing the vertical, turns about a fixed axis in the middle of the meridian; its other end is adjusted to pass along the circle of the horizon. With this system, then, it is possible (1) to trace arcs of a great circle on the sphere and measure their lengths; (2) to measure the angles formed by two great circles.—*Iron Age.*

SCIENTIFIC PROGRESS.

New American Industries.

The recent rapid increase in American chemical manufactures—in many cases from native crude materials—is a very encouraging feature of American trade. The *Grocer* notes that six years ago we imported from France cream of tartar to the extent of 9,000,000 pounds yearly; but so successful has the manufacture of it in this country been carried on, that last year not a single pound was imported. Notwithstanding the crude materials have at present to be imported, the price of the manufactured article has been reduced from 32 cents per pound, the rate for the French article, to 23 and 24 cents per pound for the American production. France and England formerly sent us annually 500,000 pounds of tartaric acid, while the importation for the last fiscal year was 183 pounds. England formerly monopolized our market for nitric acid to the extent of 250,000 pounds annually, at the rate of $1.30 per pound, while last year 27,018 pounds were imported and sold at the same price as the American article—57 cents per pound. At present the lime juice from which citric acid is made has to be imported, but it could easily be produced from fruits grown in Florida, if only sufficient energy were put into the work. If the lemon and lime growers of the South can be induced to prepare the lime juice, the entire production and manufacture of citric acid will be kept in this country, saving hundreds of thousands of dollars annually, and developing another great industry. Borax was formerly brought from England at the rate of from 600,000 to 1,000,000 pounds per year. Owing to the development of borax mines in Nevada, this importation has largely fallen off, and the report for the last fiscal year showed only 3,492 pounds, and the price of the refined article, which is now prepared in New York city, is only from 8 to 9 cents per pound, when formerly it was 35 cents, England being now among the buyers instead of the principal seller, as she once was, both of the crude and refined product.—*Manufacturer and Builder.*

A Great Russian Telescope Projected.—At a meeting of the National Institute in Washington, May 29th, Prof. Newcomb stated that he has received letters from Otto Struve, Director of the Pulkowa Observatory, announcing that the Russian government has voted 250,000 rubles for the construction of the largest telescope that can be advantageously made, including the building in which to mount it. The object glass is intended to be between two and one-half and three feet in diameter, if the glass makers find it practicable to cast a disk of this size of the necessary evenness and purity. It has not yet been decided who shall undertake the most difficult part of the work, the grinding of the glass; and before deciding it Struve intends to visit this country in order to examine the Washington and other great telescopes made by Alvan Clark & Sons. He will probably arrive here for this purpose some time during the summer. Should his examination prove satisfactory he will be ready to open negotiations with the Clarke for the work if he is sure it will be done enough better to warrant the risk of sending the glass twice across the Atlantic.

Iron Atmosphere.—Observations of snow collected on mountain tops and within the Arctic circle far beyond the influence of factories and smoke, confirm the supposition that minute particles of iron float in the atmosphere, and in time fall to the earth. Some physicists believe that these floating particles of iron are concerned in the striking phenomena of the aurora. Gronemann, of Gottingen, holds that streams of the particles revolve round the sun, and that when passing the earth they are attracted to the poles, and thence stretch forth as long filaments into space. But as they travel with planetary velocity they become ignited in our atmosphere, and thus produce the luminous appearance of auroræ. In his recent voyages Prof. Nordenskjold examined snow far in the north beyond Spitzbergen, and found therein exceedingly small particles of metallic iron, phosphorus and cobalt.

Electric Pens.—The most recent of the brilliant series of telegraphic marvels which have from time to time, and especially of late, engaged the world, is the "telegraphic pen" of Mr. E. A. Cowper, the well-known engineer of Great George street, Westminster. There had been hitherto no lack of copying telegraphs, all of which instruments telegraph an almost perfect copy of the writing submitted to them, but the process is necessarily complex and slow; whereas, by the new device, a person may take the writing pencil in his hand and himself transmit his message in the act of writing it.

New Scale.—By making a miniature of an object, such as a spider line, and examining it with a microscope, Dr. Royston Pigott has found that objects even as small as the millionth of an inch could be seen; and in a late communication to the Philosophical Society, Cambridge, took exception to the view generally prevailing among opticians, that it is useless to attempt further perfection of the microscope.

Use of Glass Thread.—To make fine glass thread, the glass is brought to a state of fusion, a glass rod dipped in it, and thus a thread pulled out, which solidifies first in its thinnest parts, and so causes a thread of uniform thickness to be obtained. If this thread is placed over a hot metallic cylinder, and the latter revolved, any length of thread may be obtained; the thread may be obtained finer by revolving the cylinder more rapidly. The heating of the cylinder has the effect of annealing the glass to some extent, while the rapid cooling, if wound on a cold cylinder, would make it more brittle. A bundle of such threads look like a bunch of silk, and it has therefore been called glass silk. Its usefulness to chemists and druggists has lately been brought to the notice of the French Societe de Pharmacie by M. Limousin. It is now largely used in Germany, and especially in Austria, for filtering liquids in laboratories. In the microscope the threads are as fine as those of silk or fibrillæ of cotton; they break more easily than the latter, but are excessively supple. From the unalterability of the substance it is very well suited for filtering acid or alkaline solutions, even concentrated, and various other substances, such as nitrate of silver, albumen, collodion, Fehling's liquor, etc. It affords great rapidity of flow, with good filtration, it does not, like filters of paper or tissue, communicate organic matter to the liquids, altering and perhaps giving them a disagreeable taste. It is much preferable to asbestos, which, from the arrangement of its parallel fibers, cannot be formed into a flexible ball, and which lets fragments pass that float in the liquid. For analysis it is very advantageous, allowing of a ready determination of insoluble matters deposited; also by calcination and fusion of the glass may be found the volatile principles fixed in the passage of the liquid, unmixed with empyreumatic products. Notwithstanding the price of glass silk is still high, it is no great expense to use it, as its excessive lightness admits of a considerable number of filtrations being made with a small weight of it; besides, it may serve an indefinite time, if after each operation it is thoroughly washed with water and dried in the air.—*Manufacturer and Builder.*

How to Get Rid of Flour Mill Dust.—A French process designed to circumvent the perils traceable to dust in flouring mills, is thus described: The stones should be surrounded as completely as possible by a movable covering of wood or sheet-iron, which should have no opening in front but what is absolutely necessary for the work. In order to avoid the choking up of the ventilating pipes, it is necessary to provide special discharge pipes for the water, according as the stones are partly below or entirely above the floor. Again, the passages intended for carrying the dust should be placed underneath the stone, and beyond the point where the work is applied, regarding the direction of motion; it should have a breadth a little greater than that of the stone, and a depth of eight inches at most, for the largest stones, a sliding door serving to close it whenever dry dust is not produced. The water discharge pipe should also have a valve, which may be closed when water is not used, and when it is desired to carry of the dust produced when the stone is trued. If there are only four or five stones in the work, a single collecting pipe will suffice, and the blower should be placed at the end; but if there are eight or ten stones in one line, a second collector, 16 inches by 12 may be placed in the middle of the length of the first, and perpendicular to its direction. If, too, there are two long parallel rows, with eight or ten stones in each, they should be connected with the second collector, or with a third, 16x20 inches, communicating with the ventilator.—*Exchange.*

Taming Horses by Electricity.—Foreign papers inform us that the General Omnibus Co., of Paris, has for some time past made successful use of electricity in subduing vicious horses. Upon passage of a weak current (by a small induction machine of the Clarke system, the wires of which connect with the bit) into the mouth of the animal whenever he becomes restive, his will seems for the time "almost annihilated;" he leaves off rearing, kicking, or biting, and submits peaceably to be groomed or harnessed. The idea of utilizing this agency for such a purpose found expression at the exhibition last year; in the Swedish section was an apparatus with this object, the construction, action and effect of which is thus described by the London *Live Stock Journal:* "It consisted of a small box containing a battery, the wires of which communicated with the bit by the reins. In the case of resistance by the horse, the driver had merely to push a button, when a current passed immediately, and the animal became docile. The employment of electricity is said to produce a sort of uneasiness or torpor, rather than pain, and is much less harbarous than many taming methods hitherto adopted, such as those which depend on weakening by deprivation of food, on fatigue, etc."

New Globe.—M. Clemandot, of Paris, has invented a globe for electric lights. It is double—one globe placed inside the other, and the space between is filled with powdered glass. It is said to diffuse the light without lessening the illuminating power so much as the opaline globes generally used.

The Mining Share Market.

Failnre of a crosscut and non-appearance of ore bodies in levels where expected, bave caused disappointment and a depression in certain quarters, from wbich the market fails to rally. Although the controlling powers seem to have supported their expectations witb an outlay of coin, the fear of tbe "gift-bearing Greeks" bas prevented a general movement on tbe part of outsiders, and a feeling of safety exists in spite of the dull and weak market. Rich finds and glowing accounts do not appear to excite the cupidity of investors so much as formerly, and a common sense caution seems now to pervade the minds of those who heretofore have passed the time dreaming of "Aladdin's lamp" and sudden wealth througb wildcat sources.

Bullion Product.

The bullion product of tbe United States for 1878 was, in ronnd numbers, $85,000,000. There was a falling off in Nevada of about $16,700,000, but a general increase in the national production outside tbe Comstock.

Russian possessions, increasing slowly, and now some $18,000,000 per annum. Hungary and Trannsylvania; decreasing now about $1,300,000 per annum. Asia, irregular; probably $2,000,000 can be expected, and about one-half tbis amount from Africa. Soutb America; decreasing rapidly, witb a present total production not to exceed $8,000,000 per annum. Australia; decreasing, with a present annual production of abont $20,000,000. New Zealand; steady, $6,000,000 per annum.

As to silver, Great Britain is steadily producing about 600,000 ounces per annum; the Norway mines about 200,000 ounces, and the Sala mine, in Sweden, about 24,000 ounces per annum.

Tbe Scbemnitz district, tbe main producer of tbe Hungary, Transylvania and Banat silver mines is fallng off, aud its annual production of 1,000,000 ounces, is decreasing. The Freiberg mines, of Saxony, now yield some 750,000 pounds per annum, and are sustaining this yield, but the rest of Europe does not probably produce 300,000 ounces per annum.

Mexican production is steadily decreasing, and now does not exceed 18,000,000 ounces per annum, against quadruple that 40 years since. Tbe yield of Peru, Chile and other Soutb and Central American States, is rapidly decreasing, and togetber does not exceed 6,650,000 ounces, or about one-balf tbe average annual yield of Cerro de Rasco mines for a century after tbeir discovery.

ADULTERATIONS OF FRENCH WINES.—It seems tbat the Frencb government is awaking to tbe adulteration of wine with fucbsine. The government has heretofore taken measures to stop it in tbe home nsed wine, and now it is seen that the exportation of this adulterated stuff must sooner or later destroy the foreign trade in Frencb wine. Probably tbe rapid growth of demand for pure California wine is aiding in bringing attention to tbis matter. The action by tbe French government is taken too late, but seems to be vigorously pushed. A large consignment of wine adulterated with fuchsine has just heen seized at Malaga, where tbey bad arrived from Valence. The Ministry has consequently directed the authorities at all tbe French ports, and on the Spanish frontier, to cause all wines intended for export to he analyzed, and to allow only sucb to pass as are found pure.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

RICH ROCK.—*Dispatch*, June 21: Mr. Owen Kelly, proprietor of the Kelly mine, on Murphy's ridge, showed us an extraordinary rich piece of quartz which he had taken from his claim, only a short distance below the surface, last week, which contained a large amount of gold, varying in size from the point of a pin to that of an ordinary pea. The ledge, he says, is 15 ft wide at the top, and gives every indication of increasing in width as they go down. He is now running a tunnel for the purpose of tapping the ledge at a depth of about 1,500 ft from the eurface, and now has only about 100 ft further to run before striking the main body of rock.

ITEMS.—*Ledger*, June 21: The Amador gravel company, whose claim is situated two miles east of Jackson, are operating on the gravel bank with two "giants" and 400 inches of water. The ore from the Lorraine quartz mine, near Jackson Gate, recently hauled to the Moore mill and crushed, surrendered between $6 and $7 per ton. The rock so far crushed from Millo's claim is reported to have yielded a paying quantity of gold.

BUTTE.

ITEMS.—*Record*, June 21: The stay of injunction in the Keyes' debris suit expired yesterday, and we understand that Sheriff Harkey will serve the official papers on the mining companies to-day.

MINING NOTES.—*Mercury*, June 20: San Francisco capitalists have organized a mining company under the title of the Alki mining company, and began operations upon the West Branch, about two and one-fourth miles from Dogtown. Numerous nuggets have been taken from the mine, the largest weighing two ounces and the smallest worth $1.

CALAVERAS.

ITEMS.—*Chronicle*, June 21: A clean-up lately made at the Mammoth hydraulic, Tunnel ridge, yielded some hundreds of ounces. Another clean-up was lately made at the Bonanza hydraulic, Miller & Co. proprietors. The dividends declared by the Bonanza during the year are said to have aggregated the sum of $2,000 per share.

EL DORADO.

NOTES.—*Democrat*, June 21: Encouraging developments have been made at the Placerville gold quartz mining company's (the old Pacific) claim. The company have purchased the St. Lawrence mill and are setting it up. The Index mine, about one mile west of Spanish flat, has reached a ledge about eight ft wide, with footwall of slate and hanging wall of slate streaked with serpentine, and from this ledge have been already taken out a number of very handsome samples of quartz, in which the free gold is liberally disseminated.

MONO.

SYNDICATE.—*Standard*, June 19: The Syndicate company is out of debt and has $20,000 in the treasury, besides $10,000 worth of supplies ahead. A crosscut is to be run from the north line of the Tioga company's claim across the bluff from the Bechtel to the Blackhawk.

MARYLAND CON.—An increased force of miners has been put on in this mine, and now two shifts of men have been set at work.

MAMMOTH.—*News*, June 19: We learn that another rich body of gold-bearing rock was struck in the winze going down from the second crosscut in the middle tunnel of the Mammoth mine, at Lake district. Our informant states that the present find exceeds in richness any ever discovered in this really wonderful mine.

NEVADA.

HYDRAULIC MINING.—Grass Valley *Union*, June 21: There are very few hydraulic claims that will pay by drifting, as the ground will yield so little gold to the cubic yard that a very large amount of earth must be removed by the speedy and cheap process of using a large head of water. To drift such claims would be a dead loss to the claim owner. They must be worked by hydraulic process, or not at all. There are some claims that of necessity must be drifted, as the amount of earth lying over the pay channel is too great to be removed; but these claims are invariably richer than the hydraulic ones.

ITEMS.—*Foothill Tidings*, June 21: Wilson Foster and John Orissel will soon commence operations in their quartz lead near the Yuba mine, above Washington. They have a vein of very rich quartz about four inches thick at the top gradually widening as they go down, so that at a depth of 14 ft it is about 18 inches wide. The Hathaway company (gravel), near Omega, are running night and day. They have passed through the bar heavy boulders on the front and have come into splendid-looking blue gravel, containing many rich nuggets of gold. Their supply of water will last six weeks or two months longer. The Live Yankee mine is developing finely. They have 60 tons or more on the dump, and are taking out three tons each shift as they drive along the ledge. A clean-up of $2,200 was made from ore from the Scadden Flat mine Wednesday. The yield per load was not ascertained, but the run is stated to be a favorable one. Talbot's gravel claim, on Gold flat, is being worked regularly by six or more men. Hydraulicking has been abandoned and drifting commenced at the south end of the channel. The gravel looks well. The tunnel of the Planet gravel claim is now in a distance of 1,880 ft, at which point an upraise is being made into gravel. Drifts will be run to prospect the claim. A mine is being opened under the very heart of Nevada City, and promises well. The Orleans mill is now running through a crushing of Centennial rock.

ORIENTAL.—Nevada City *Transcript:* The mill is running steadily on No. 1 ore, and the plates are looking well. They are pushing the work on the fifth and sixth levels with indications of making a rich strike soon. The vein is nine ft wide at bottom of shaft in ore assaying $24 per ton.

PLACER.

THE ALHAMBRA.—*Argus*, June 21: The Alhambra mining company are now erecting a 10-stamp mill and hoisting works about three-fourths of a mile east of Penryn.

ITEMS.—*Herald*, June 21: At Independence hill the Superintendent of the old Metcalf & Reno claims, in 64 days (24 hours each), with a 500-inch stream, 300-ft pressure, has washed eight acres, averaging 75 ft deep, which will give an average of over 10,000 cubic yards of gravel per day. Though this ground will only average three and one-third cents per yard, the total purchase money and expense of fitting up have already been paid this season. The cost per day was $120, including water. The sluices are 40 inches wide, with 12 inches grade to the 12 ft; undercurrents 100 inches wide and 50 ft long, with grade 18 inches to 12 ft.

SIERRA.

DERBEC MINING COMPANY.—Downieville *Messenger*, June 21: This company has put in three shifts of eight hours each and pay $2.50 per day.

BONANZA TUNNEL.—One thousand one hundred ft have been completed. The facewall gravel; 50 to 00 ft of tunnel are being made every week.

PLUMAS EUREKA.—From Dr. Leonard we learn that the Plumas Eureka mine is now giving employment to 250 men. A new 40-stamp mill, run by a turbine wheel, has just been completed, and will crush about 100 tons of ore daily.

SHASTA.

BULLYCHOOP.—Reading *Independent*, June 10: Morning Star mine is having a five-stamp mill erected. Red Bluff mine has 100 tons of rich ore on the dump. A pack-train will carry the ore two miles to the mill. The Bullychoop company are running a tunnel to tap their ledge at a depth of 300 ft.

TUOLUMNE.

SILVER ORE.—*Union-Democrat*, June 21: James Tullock came to town on Wednesday, after an absence of two months at the mining claims he is developing, about 60 miles east of Sonora. He brought ore from two different veins which carry silver and promise very well from assays already made and will have the ores further tested.

YUBA.

LONE TREE HILL.—J. M. C. Jasper has shown the Wheatland *Recorder* a specimen from the newly-discovered quartz mine, located about eight miles east of Wheatland, in the vicinity of the Lone Tree hill. It is claimed that it is the richest quartz discovery ever made in this section. The ledge runs in an easterly and westerly direction, and pitches north. The shaft, from which this piece was taken, is now down 50 ft. The ledge is two and a half ft wide. A crushing was made of a piece not much larger than a pound weight, in a hand mortar, and yielded about $1.50 worth of gold.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA-MEXICAN-UNION SHAFT CO.—Gold Hill *News*, June 25: Shaft has attained 145 ft below 1700 level of Sierra Nevada, passing through hard blasting porphyry.

ALTA.—North drift, on 1500 level, is 30 ft in Lady Washington ground, and in quartz. North drift, 1750 level, has been run 128 ft, touching the clay of the vein, and turned parallel with ledge.

SUTRO TUNNEL.—The sub-drain has not been completed clear up to the Savage connection, but the boxes have been laid and connections made with the mines ready to conduct the water off.

TROJAN.—Northeast drift, 3d level, is in lively quartz. North drift, 2d level, is in low grade ore. Total length, 100 ft.

BULLION.—Bottom is in hard vein porphyry, carrying seams of clay and quartz.

OPHIR.—Tank at 1465 station completed, ready for connection with the Sutro tunnel; 1200 bob-station enlarged and retimbered. Good milling ore and fair vein matter is being encountered.

UNION CON.—Incline in 83 ft, the face in cap rock, containing richer stringers of quartz.

BELCHER.—The south crosscut, 2560 level, has struck more quartz, and found some water.

NORTH BONANZA.—An upraise is commenced to meet the Rule winze and connect it with the 200 level. South drift, into Flowery ground, has been swung around to the west to reach the edge of the ledge.

OVERMAN.—Vertical winze, below 1000 level, is encountering much water. Heavy flow of water in Forman shaft—150,000 gallons daily.

SIERRA NEVADA.—Heavy flow of water in Incline—200,000 gallons daily. Final shipment of bullion for June will be made July 1st.

CON. VIRGINIA.—Shipped last evening, 12 bars bullion valued at $57,233.39. Total for month, $101,515.44. Joint west drift, 850 level, is being pushed through a soft, moist formation, which requires timbering. South drift, 2150 level, is in 200 ft, with face in vein matter, carrying quartz in stringers.

JUSTICE.—Veins and spots of ore encountered on the 1300 level, in crosscut five, and in the lateral drift.

SAVAGE.—Connection with Gould & Curry on 1600 level completed and all ready for Sutro tunnel. Water in mine remains stationary.

CON. IMPERIAL.—Drift on 2600 level averages six ft per day along wall of the vein; total length, 306 ft.

CALEDONIA.—The Forman shaft is down 750 ft, encountering a heavy flow of water.

GOULD & CURRY.—Face of joint east crosscut, 1700 level, is 900 ft from lateral drift.

WARD.—Strong flow of water in bottom of shaft, which is down 1,520 ft.

SILVER HILL.—Breaking a pump flooded the mine last Friday week to 90 ft. Upper workings yielding low-grade ore.

LADY BRYAN.—East drift, on 750 level, is in vein porphyry carrying streaks of quartz. Pumps lowered to 750 level, air pipes carried down and shaft partitioned for ventilation.

YELLOW JACKET.—East and west drifts both cutting hard porphyry.

UTAH.—Excavations for a balance-bob in the Incline have been commenced.

BROPHY.—Tunnel shows indications of nearing the vein.

EUREKA DISTRICT.

BELMONT.—Some rich ore bodies are being opened up in this mine. Specimens brought in show a yield as high as $1,000 to the ton in silver when run through the mill.

GOOD HOPE DISTRICT.

AURORA.—This mine has an incline 140 ft deep and drift of 50 ft on a four-ft ledge; all milling ore assaying from $20 to $2,000 per ton. The mineral is ruby, native and stephenite. There are 40 tons of ore on the dumps, which will mill from $200 to $500 per ton.

PAGE & KELLEY.—This mine adjoins the Aurora. Incline 130 ft deep on ledge and 25 ft of drift at bottom. Vein between walls is four ft thick, 20 inches of it ore; assay from $60 to $2,700.

YOU AND I.—Carries same character of ore as Aurora; three tons of the ore worked $200 per ton.

JUNGO DISTRICT.

THE mines in this district are reported rich and permanent. The leads are well defined and the ores rich enough to pay for shipping them.

PARADISE DISTRICT.

BULLION.—*Silver State*, June 21: Bullion valued at $1,800 was received at Wells, Fargo & Co.'s office here yesterday from the Sedan mill, Paradise valley.

SOLID SILVER.—*Sentinel*, June 21: Shaft down 40 ft in a four and one-half ft vein, and plenty of free milling ore taken out.

BIG PRIZE.—A rich body of ore is reported to have been struck. A piece was shown the size of a hen's egg and more than half silver.

PIOCHE DISTRICT.

BLUE BELL.—A rich body of ore has been struck at a depth of 80 ft.

MAYFLOWER.—The ore in the stopes, north drift, averages five and one-half ft in width; assays lately made range from $167 to $235 per ton.

HILLSIDE furnace is running steadily. The assay value of bullion output in May amounted to $65,102.83. In the west drift, fifth level, a body of ore has been encountered the same as that above it.

A LEDGE has been discovered in Buffalo canyon, four miles from Buffalo station, on the Idaho road; ore assay, $155.16 per ton.

UNION DISTRICT.

MINES upon which croppings assayed only $20 to $25 are found to yield at 10 ft from surface ore at $60 per ton.

ARIZONA.

MINING NOTES.—*Silver Belt*, June 18: We understand that at the depth of 150 ft a great improvement is visible in the ore body of the Independence lode. It is richer than it has been heretofore, is more compact and more abundant in quantity. McCargil, Martin and McCarthy are running a drift into the Continental from the bottom of another shaft near the gulch, and will strike the Continental vein at about 40 ft from the surface. Mr. H. C. Hoffman, of McMillen, has just had 55 pounds of ore specimens worked at the Haskin mill, and as the product was 19 pounds six ounces of bullion, nearly 800 fine, our readers will understand that the Globe district ores are unusually rich. The specimens referred to came from different mines in the district and averaged one-third pure silver.

MOHAVE COUNTY.—Phœnix *Herald*, June 18: Mohave county is said to contain some of the richest mineral deposits in this Territory. The Congress mine, in Cedar valley, is now down 74 ft, but is to be put down to a depth of 200 ft. Some 35 tons of ore have been shipped to San Francisco averaging $478 to the ton. The ore seam is 10 ft wide between granite and porphyry. Hoisting works will soon be erected. The miners are well pleased with their property and think they have a bonanza.

SILVER KING MINE.—*Sentinel*, June 14: The new working shaft is down 107 ft, vertically, and will strike the principal vein, which inclines at an angle of 45°, in about 25 ft more. The incline following the vein is down 265 ft. Complete steam hoisting works are on the ground and would have been working before now but that the shive was sent by mistake to Silver Hill, Nevada. The new shaft is now 50 ft below the fourth level, on which level the vein is 77 ft wide. The ore-breast on the third level measures 42 ft. The walls are perfect and of syenitic granite. Plenty of fuel and water, the amount of ore inexhaustible, 5,000 tons on the dump and 30 tons per day are reduced to concentrations. Sixteen thousand pounds were sent to San Francisco last week.

TOMBSTONE DISTRICT.—*Star*, June 14: Eight bars of bullion, valued at $18,744, have just been received by Safford, Hudson & Co., for Gov. Safford, of Philadelphia. This is the first shipment of bullion by the Tombstone company, and is the result of third class ore. There is another lot of about $20,000 at the mill awaiting transportation, and it is estimated that ere many days the Tombstone mill will run out at the rate of $5,000 to $10,000 per day.

THE HERSHAW MINES.—They consist of a group of nine mines, the Hardshell, second eastern extension of the Hardshell, Sotella, Hermoso, Salvador, South King, Fagan, Scotty, and Surveyor. There are seven cuts on the Hermoso. Eight hundred ft of the claim shows excellent ore. The depth of the main shaft is 25 ft. The ore vein is 18 ft wide, and grows richer with depth. The Salvador has two cuts, one seven and the other eight ft in depth, with same character of ore as the Hermoso. The Hardshell has a cut 30 ft across the ledge, with 30 tons of ore on the dump. This cut is on the south end of the mine, in a deep gulch. From this point a tunnel will be run in on the ledge. There are two more cuts 200 ft from this; both show good ore. The Hardshell has a 12-ft shaft, all on ore; the width is not yet ascertained. Horn silver has been found in various quantities at all points of development. The South King has two cuts, the Fagan one. The character of the ore is low grade, but in large quantities. All of these properties are free milling ore, situated within a radius of one mile. The mill site is only one and a half miles from the farthest location of the group. Water and timber are plenty; oak on the highlands, ash and cottonwood in the valley.

COLORADO.

LADY GAY.—*Silver Cliff Prospector*, June 13: At the distance of seven ft in this lode, a vein of galena and gray copper has been encountered. One piece weighing 88 pounds taken from this lode, can be seen at Mr. Mulkey's place.

WYANDOTTE CHIEF.—A recent assay in this lode ran as high as $1,100.

JAYHAWKER.—An assay of rock taken from this lode ran $4,317.76.

ROCKY MOUNTAIN.—This lode is now working in an 18-inch vein.

CENTRAL CITY.—The *Golden Globe* says: Three men are working the placer mines at the mouth of the canyon, cleaning up $60 to $80 per week.

BOULDER.—*News*, June 13: We were shown fine specimens of manguisite and tellurium, from the Logan mine, on Sugar Loaf. Considerable ore is coming out, running as high as $10.

DOLLY VARDEN.—The returns from the last mill run of a large lot of ore was as follows: First class, 024 ounces; second class, 313 ounces; third class, 200 ounces.

MASTODON.—Fine mineral has been struck.

SAN JUAN BULLION CO.—Tunnel on the Loma lode is in 125 ft, and good ore is being taken out.

BIG GIANT.—Shaft down 25 ft and tunnel 30 ft. Has a good streak of galena and gray copper.

RED ELEPHANT.—A vein of ore has been intersected in this mine, which is 20 inches solid, and 24 inches scattered. Mineral assays 150 to 200 ounces of silver per ton.

IDAHO.

MAMMOTH MINE.—*World*, June 17: This mine, on Summit Flat, has between 700 and 800 tons of good ore on the dump. The mill is running.

BONANZA CITY.—About 150 men are prospecting in the Saw-Tooth range, and have found some very rich float. Between 1,000 and 1,500 men are prospecting in the Salmon river country.

ITEMS.—The Buzz Fuzz shaft is down 25 ft, and a small feeder, that contains gold, has been crossed. The mine will be reached in about five more feet. Mr. James Freaner has discovered a ledge somewhere near the head of Thorn Creek ditch, that assays $32 per ton in silver.

YANKEE FORK.—Immigration to this section has been immense during the past three or four months, but there are now scarcely 300 people in both Challis and Bonanza City. Men accustomed to mining camps can see at a glance that there is nothing to do, and many of them have gone to Montana, Salmon river mines and other portions of Idaho. The mines are rich beyond anything that has been said of them, but with the exception of two, are non-producing, and must necessarily be so until their owners can erect mills. A small quantity of ore has been sacked and shipped to Salt Lake from the Norton mine, and the yield was very large. About $1,500 per ton is considered a fair average of the ore already taken from this mine.

UTAH.

BULLION.—*Tribune*, June 19: The receipts of refined bullion at the Union Pacific Express office yesterday, were six bars Ontario, $5,197.32; two bars Silver Reef, $2,511.70; total, $7,709.02. Wells, Fargo & Co. received bullion as follows yesterday: Four bars Horn Silver, $5,503.97; one bar refined silver from Silver Reef, $1,591.02; total, $7,184.90. Their shipments were one bar Horn Silver, valued at $2,000.

WYOMING.

NORTH PARK.—A special from Laramie says: There is great excitement here over the rich silver mines discovered near this city, on the rim of North Park. A great many specimens of ores, both carbonate and chlorides, have been brought into town this week, all of which assay from $200 to $600 per ton. An official assay by the Territorial Assayer certifies the ore to be lead carbonates, and contains 443 ounces of silver per ton. Experienced miners are confident that this new mining district is fully as rich and extensive as Leadville. The new camp is about 75 miles from here, and easily reached by teams. People are rushing in there from all around this section of country.

Bullion Shipments.

Since our last issue we have noticed tbe following shipments:

Con. Virginia, June 17th, $44,282.05; Hillside, June 22d, $4,250; June 24th, $4,672.24; Belle Isle, June 23d, $22,000; Ophir, June 21st, $20,044.59; Northern Belle, June 16th, $2,276.96; June 18th, $2,341.41; June 21st, $4,672.24; Independence, June 23d, $13,000; California, June 19th, $45,880.16; Indian Queen, June 16th, $4,318.44; Bodie Con., June 24th, $37,000; Standard, June 20th, $21,932.16; Keuton, June 21st, $1,927.90; Alexander, June 19th, $7,096.

THE President bas witbdrawn the nomination of George W. McCrary for the Judgeship made vacant by tbe resignation of Judge Dillon.

The Telluride Ores of Gold.—No. 3.

[Thesis by RUSSELL L. DUNN, College of Mines, University of California.]

Mines and Mining.

The mining of the telluride ores of gold has on the whole been a fairly profitable business, and it is safe to say that the proportion of failuree is no greater in this than in any other class of mining enterprise in the same region, the common belief amoug mining men notwithstanding. Thie feeling of failure is perhaps, in some measure, due to basing expectations of constant yield on the extraordinary richness of the surface pockets, an expectation the history of mining has shown to be very rarely fulfilled. The truth of the matter is, that of the veins located on with fair indications and surface prospects, a greater proportion yield higher returne than is the case with the ordinary class of gold-bearing veins. Consider California: How many of the almost innumerahle lodes worked have paid even expenses? Again, the average value of the ore of the former is much higher, $20 ore heing a very low grade for it, while the same amount in a free gold-hearing rock would he considered fair. Colorado is the hest place to study the peculiarities of the mining, as it is carried ou there more extensively than anywhere else, more correctly and with a greater measure of success, owing to more extensive deposits.

The first discovery was of what is now called the Red Cloud mine, on Gold hill in Boulder county, at some time in the autumn of 1872. Free gold-bearing veins had been worked here, and after yielding fairly for a time had ceased to give any ore and heen ahandoned, and the future of the district seemed to rest on its silver mines, among which the Caribou and Native Silver are prominent. A couple of gold miners who stuck to the district when it was being deeerted hy almost everybody else, found some peculiar looking float in one of the streams and had it assayed. The ton valuation ran up into the thousands. The miners, searching for the source, found the outcrop of the Red Cloud vein underneath 12 feet of soil. *The vein was enormously rich where they commenced to eink on it, and 10 assays made on ore taken at intervals in the first 25 feet varied from $167.87 to $25,942.31 per ton, the average gold being $6,468.47 and the average silver, $2,823.63. The discovery immediately attracted a great deal of attention and caused the usual rush to the locality. Within the next two or three years all of the really valuahle mines and hundreds of others were located, the latter comprising far more than the usual numher of wildcats.

Of these mines only ahout 20 havc paid much, due in a measure to their more thorough development. Most of the so-called mines are nothing hut prospect holes sunk around a bunch of ore, the owners having failed to sell them at an excessive figure duriug the first excitement, have lacked the enterprise and linancial ability to explore their property. Unless a rich pocket or chimney is struck on commencing work the opening of one of these mines is a very tedious and discouraging operation. It may be said though of all that have reached a depth of 100 feet, the majority have at least paid expenses. Very few have heen explored much heyond 400 feet, and at that depth the ore seems very poor in tellurides and is not as a rule workahle with profit. It was at thie and greater depths that the mines of Nagyag and Offenbanya are said to have paid best.

The grade of ore yielded averages high. Comparatively large amounts of first-class ore, ranging in value from $700 to $15,000 and upward per ton have been taken out; of second-olass ore, or ore worth from $200 to $600 per ton, a still larger amount has heen ohtained; while third-class ore, $15, $20, $30, etc., rock forms a good proportion of the entire vein matter.

The description and history of some of the mines, with their yield of metal, will perhaps show better thau any general account, the peculiarities and value of these deposits.

The Melvina, discovered in the Gold Hill district in the summer of 1875, is remarkable as yielding the largest proportionate profit of any mine in the couutry. For a long time the net profits were 80% of the gross yield. In the firet 15 months it was worked, it produced 151.035 tons of ore, which sold at the mine to the smelters for $84,600, an average of $560 per ton. [The assay valuation must have heen at least 10% higher, making the average value per ton ahout $615.] The total outlay during the same period was only $8,000. In 33 months the mine produced $175,000. Small lots of ore sold at rates varying from $10,000 to $18,000 per ton. Nearly all of the ore ahove mentioned was taken out iu sinking the shaft, which followed a rich chimney in the ledge. The vein where richest is a soft clay ahout eight inches wide.

The Smuggler mine was located in Ballarat district in April, 1875, and commenced producing in the latter part of the same year. The country rock is gneiss, very nearly approaching mica schist in structure. In 1877 60 men were employed, of whom 13 were ore sorters. The mineral contained in the sorted ore consisted of sylvanite and eome arsenical and iron pyrites, and assayed ahout $400 per ton. The mine yielded during the month of April, 1877, 19 tons of second-class ore which sold for $7,000, and 50 tons of third class which sold for $2,000; in all, $9,000, at an outlay of $4,500.

*The Slide lode is located on the northern slope of Gold hill, in Gold Hill district. The vein lies hetween gneiss on one side and a dike of porphyry on the other. It ranges in width from four to ten feet, presenting all the indications of a heavy mineralized fissure vein. The ore shows a tendency to cling to the footwall which is gneiss. Considerahle of the rich ore milled $2,627 per ton.

The Red Cloud and Cold Spring mines bave already been mentioned. †Within two years and a half after discovery, they produced $600,000 from ahout 400 tons of ore, which therefore averaged $1,500 per ton.

‡The American mine is in Sunshine district. It is located on a fissure vein in gneissic granite. The following tahle will show tbe assay value of specimens of telluride ores from the American mine, and exhibited at the Centennial exhihition in 1876. The specimens were of course picked, hut contained much gangue. They weighed from 5 to 150 pounds each. The assaye were made by Mr. J. Alden Smith:

No. of Specimen.	Description of Ore.	Gold (in oz.) per T.	Silver (in oz.) per T.	Value per T. (approximate.)
0	Surfacc ore	3,170	140	$63,531
1	Sylvanite with gangue	1,500	160	30,178
2	Mixed	050	100	13,115
3	Auriferous Hessite	475	6,835	17,360
4	Mixed	379	5,461	13,800
7	Sylvanite	2,373	792	48,370
8	Mixed	300	110	6,126
9	Mixed	1,200	180	34,217
9	Mixed	250	95	5,109
11	Mixed	1,000	280	20,308
17	Sylvanite and gangue	2,050	240	41,276
18	Sylvanite and petzite with gangue	2,486	1,170	51,055
10	Surface ore	000	888	13,560
20	Surface ore	3,760	202	76,432
21	Surface ore	812	5,228	22,252
22	Auriferous Hessite	800	6,081	24,020
23	Petzite and sylvanite	2,908	1,732	60,120
24	Tellur-pyrites	2,373	792	48,331

Five tons of ore from this mine sold in Omaha (in hulk) for $5,050 per ton, coin. [To sell at this figure it must have assayed ahout $6,000 per ton.]

As less has heen written ahout tbe California mines where the ore consists of gold-hearing tellurides, and as many differencee exist between them and the Colorado mines, I give an extended description of two of the mines, the most important.

The Stanislaus mine, in Calaveras county, is the most developed of the California telluride mines, as well as the most important on account of its past yield. As it has heen carefully examincd several times, I give quite full and accurate data: §Dip, 75° east; width of vein, six feet (average); walls: east, regular; west, irregular and composed of numerous quartz feeders, which follow the stratificatiou and contain carhonates and tellurides. Vein matter: white quartz with sylvanite as an ore; also tellurides of silver, lead and nickel; feldspar, carbonates of calcium and of iron; pyrite. [I have examined numerous hand specimens of the ores from this mine, but in no instance have I observed any sylvanite or graphic tellurium. Petzite is the most ahnndant telluride mineral. Calaverite is prohahly meant by Mr. Bowman when he refere to eylvanite. The former is comparatively quite ahundant.] Form of pay deposit: Iu chimneys dipping south and in the seams and feeders of the west wall. (In the majority of casce in mines on the Mother lode, the pay chimneys dip north.) Free gold. Geological characteristics; the tellurides are found only in the quartz which contains crystals of feldspar, calcite and siderite. Pyrite occurs hoth in the compact quartz in the lode and in the adjacent slates, hut differing in appearance. That in the quartz occure in compact masses seldom crystallizing distinctly, with only cleavage; bright and strongly yellowish. That in the slate occurs in ieolated well-defined crystals; they contain very little gold [Coignet].

For some time after the tellurides were discovered in tbe ore, attempts were made to work the mine at a profit, hut were uneuccessful. The mine lay idle and full of water for 13 years. An attempt is now heing made to work it again. The mine has yielded, and etill yields, a high grade of ore. A considerable portion of the talcose elate wall will pay well to mill; it contains much free gold, and, it is said, some tellurets. A sample of the vein ore weighing 2.885 T, gave $3,555.94 hy chemical treatment.

The Rawhide mine, Tuolumne county, presents some points of difference from any I have thus far mentioned. It ie on the mother lode. Walls: east, elate; west, eerpentine with asbestus. Vein matter: quartz, colored green hy malachite; argentiferous gray copper (polytelite) containing tellurium and telluridea. It resembles in the character of its ore the Tellurium mine of Amador county, more than it does the mines ahout Carson Hill.

It is not prohable that the mines of Boulder county, Colorado, will again give the enormous returns ohtained on first opening them. In the majority the ore seems to diminish in both quantity and quality as we go down on the vein. In California the prospects are much brigbter; the group of mines on Careon Hill, whioh gave euch a wonderful yield many years ago, are now being reopened and worked hy improved methods. As regards permanence in depth, they seem to resemble the Transylvania mines more than they do the Colorado. The Morgan mine, which returned $2,000,000 from the croppings with the most primitive machines, the Stanislaus, the Melones and others, are not yet worked out by any means, only the eurface heing scratched. Other localities will, in all prohahility, soon commence to produce bullion. At the present time, it is not so much the lack of ore as the need of a more perfect and cheaper process for treatment, which retards the development of the mines.

IV.—Beneficiation.

The metallurgy of the telluride ores is in a comparatively unsatisfactory state, and I am safe in assuming at the outset of this discussion that no perfect process for treating these ores alone, so as to ohtain economically the fnll or nearly the full percentage of metal present, has heen found. There are, it is true, two or three smelting processes hy which small quantities of high-grade ore may he treated together with large quantities of other (hase metal, or rather hasic) ores; in this way some of the peculiar difficulties of their reduction are ohviated; even here, though, there is some loss due to the presence of tellurium. These methods which answer very well for first-class ore—constituting only about 10% of the total amount of rock raised—do not succeed so well with second-class ores. [The gangue of these ores heing exceedingly eilicious only a limited amount of the telluride ore can he put in a furnace mixture even though the other components are very hasic; the same percentage of either first or second class rock could he used, hut it would evidently require to produce the same amount of metal from the latter, as from the former, a much greater quantity of other ores, and a mnch longer period of time. The same amount of metal is therefore exposed to the action of several times as much slag and has several times as much time to fume away. The additional nercentage of loss is somewhat counterbalanced hy the correspondingly larger amount of hase metal or matte to take up the gold and silver, but not entirely. There must therefore necessarily he a greater percentage of loss in working second-class rock than is the case with first class.] As to third-class ore (unconcentrated), it may he said that it is utterly valueless for smelting purposes. Again, smelting works must he located convenient to the metalliferous deposits on which they depend for the greater portion of thcir ore supply, gcnerally in Colorado, auriferous and argentiferous lead and copper ores, or near wbere the necessary fuel is ohtained. The supply of telluride ores is too limited and insignificant from a smelting point of view, as well as variable, to pay to put up smelting works on the plan now under consideration. As no great quantity of good smelting ores, excepting perhaps auriferous iron pyrites (containiug usually a small percentage of copper pyrites) are found in or easily accessihle to the tellurium districts, more or less expensive transportation is necessary, which only high-grade ore will stand. It would of course be absurd to transport the poorest and hulkiest of the ores for euch a furnace except under peculiar and unusual circumstances. On the whole, therefore, this description of smelting cannot be considered the solution of the problem—how to work telluride ores?

Many yeare ago when the mines of Transylvania were yielding considerable quantities of rich tellurets, these ores were smelted in emall crucihles. This (at that time) was considered to give good results, its inapplicability in a general way to American conditions is so evident that I will not consider it in this paper.

For the purpose of showing at a glance the general character of all of the methods of working employed in the heneficiation of telluride ores, I have constructed a tabular synopsis. On it I shall hase the order of the detailed discussion of the different modes of reduction.

Table Showing Different Classes of Processes used for Working Telluride Ores and their Relations.

Raw Ore from the Mine				
Coarse Dry.	Crushing Plant.	Sorting Tables.		
Fine Dry.				
Smelting Furnaces.	Base Bullion. Iron Matte. Copper Matte.	Refinery. Various Wet Processes. Pearce's Process.		
Amalgamation Apparatus	Amalgam. Concentrators. Tailings.	Amalgam. 2d Class. Tailings.	Retort—Parting.	
Roasting Furnaces.	Amalgamation Apparatus. Tailings.	Amalgam. Tailings.	Chlorination Plant.	Concentrators. Tailings.
1st Class.	Crushing Plant.	Smelting Furnace. Cupellation Lead Bath.	Melting Pot.	
2d Class.	Crushing Plant.	Smelting Furnace. Crucible Smelting.	Roasting Furnace.	Chemical Processes.
3d Class.	Crushing Plant. Concentrators.	Tailings.	2d Class.	Tailings.

The procesees may be divided into two groups, according as tellurium ie present or not. The first, where tellurium is etill present or in the act of heing driven off, I call Primary. The other group, coneieting of thoee for treating the ore or ite producte after the tellurium is driven off, not being in any way peculiar or characteristic, I call Secondary. The detailed description will consider the first group, only referring to the eecond incidentally.

The essential point in treating theso ores ie the complete separation of the tellurium from its compounde, and the dieposing of it in euch a way as not to affect any suhsequent process for getting the metal out. As for the tellurium it may he said that it is absolutely worthless. Unlike arsenic and antimony it cannot be sold for chemical and other purposes; unlike sulphur, which can he converted into eulphuric acid if deeired, and used in the works, thue repaying in part the expense of the treatment necessitated hy its presence in the ore, it forms no compound of this kind (so far as yet known) which is of the elightest utility.

Raw Ore.

The raw ore as it comes from the mine is sent directly either to the crushing plant, or to the sorting tables to he first put through a dressing process.

1. The former, as the usual mode of treating gold ores, was used considerably at first, and ie still in use where a mine yields a very uniform grade of ore, or where all qualities are treated alike, the common process being assumed to give equally good and economical results for any grade or mixture of grades of ore. Generally speaking, I do not think it to he advisahle.

(*a.*) If the ore as it comes from the mine consists of practically only two grades (2d and 3d usually), and the line of treatment employed permits of wet crushing, it can be stamped wet, run through concentrators (mechanical) and there separated into second class ore and residues or tailings.

[NOTE.—In the tabular synopsis I have not indicated lines of treatment of this (*a*) character; they are not general and are comparatively very unimportant. Also I have not, except in one or two instances, made any reference to the presence or disposition of residues.]

2. A preliminary dressing on sorting tables is usually the first manipulation thc ore is suhjected to, and, owing to the nature of the ore and the special metallurgy employed, it is prohably the hest mode of procedure. On these tables the ore is hroken up with hammere and graded as follows:

1st Class—Value per ton upward of $1,000 or thereabout.

2d Class—Value per ton ahout $400.

3d Class—Value per tou, say from $15 to $75.

Residues—Barren rock of no value.

The proportion of each class of ore is variahle. If the ore is to he transported any considerahle distance to market, this preliminary hand sorting or concentration of some kind is indispensahle, and its cost will he more than repaid in lessened freight charges and a higher percentage of return.

It may not be inappropriate here to give a comparisou hetween wet and dry stamping, as far as it relates to telluride ores.

First, as regards wet stamping: The telluride minerals (more especially the gold and silver hearing) are pulverizcd [*i. e.*, converted into an amorphous powder] only with cousiderahle difficulty. They split up into fine light ecales, which float off in water over almost every contrivance which is used to catch them. Hence more or less loss of mineral will inevitably eneue. The ore must be dried and ground under a hurr wheel or some other machine, to break up lumps and the comparatively large uncrushed particles before furnace processes can be applied. With dry stamping the lose of mineral is reduced to a minimum and the ore ie ready at once for further treatment. The expense account is considerahly greater for dry than for wet etamping. The general practice seems to be to stamp dry, first and second-class ores; third-class are stamped wet and concentrated. In general, when it is intended to roast the ore the crushing is dry.

Smelting.

Telluride ores, ae has heen before etated, cannot he smelted alone, and on the character of the auxiliary material used does the nature and result of the epecial metallurgy employed depend. Before taking up epecial lines of treatment, some of the couditions common in a greater or lese degree to all of them, will he considered. These I ehall outline only in the most general way.

So small ie the percentage of metal even in rich oree, that the percentage of hase metal in the auxiliary material must he high in order to give a proper proportion of slag for the furnace mixture. The gangue is very silicious and must have some basic flux added to it, either as the gangue of the hase metal components or otherwise as fluxes. The slag must be very fusihle and fluid, either a einguello- or euhеilicate, the former usually, in order that it will not contain mucb mechanically enclosed metal; if too hasic it would injure the walls of the furnace. [It might he possihle to use a sesquisilicate, hut I know of no instance where it is done, the reason prohahly heing that it is too acid and would attack the reduced metal or matte]. If the slag becomes rich in metal it must he reworked. As a general rule it is best to have at least twenty (20) times as much hase metal as fine in the mixture of ores. Tellurium is very volatile, and gold and silver in its presence are also more or lees volatile; to reduce this loss to a minimum the emelting ehould be so carried on as to bring particles of reduced hase metal or matte in contact with unreduced particlee of the telluridea. A consideration of theee points will readily ehow that it ie not advisahle to nee more than a comparatively emall proportion of telluride ore, nor ie the reverse ever neceseary. The eupply of such ore is very

*Transactions of the American Institute of Mining Engineers, Vol. I., p. 315.

§Bowman in "Raymond's Report," 1875.

limited, of base metal ores very abundant usually, and if this be not the case in some yet undiscovered district, there are some smelting methods that do not require a continuous supply of the latter, a small quantity being used over and over again.

Losses of gold and silver by smelting occur in two ways, by slagging and by volatilization with tellurium, both of which depend greatly on the manipulation. The former has already been mentioned. The latter is not very great, in some instances imperceptible. The loss of gold seems slightly greater proportionately than the loss of silver, judging by a comparison between the assay and analysis of the same specimens. The entire loss in both ways cannot amount to much or these processes would not be so generally used to the almost entire exclusion of others in Colorado, where many modes of reduction have been tried.

[To be Continued.]

The Engineer.

The New Eddystone Lighthouse.—The tower of the famous Eddystone lighthouse is now in a fair state of efficiency, but the gneiss rock on which it stands has been seriously shaken by the incessant sea strokes on the tower, and the rock is considerably undermined at its base. It has, therefore, been determined to erect a new tower on a spot which affords a good foundation near low water level, at about 127 feet distant from the present site. The focal plane of the present lighthouse is at an elevation of 72 feet above high water; that of the new building will be 130 feet. The actual useful range of the light, which is now about 14 nautical miles, will thus be extended to 17½ miles. The new tower will be constructed entirely of granite. The hight will be 138 feet above the rock to the top of the cornice, and the diameter of the tower under the cornice will be 18 feet 6 inches. The tower will be solid (with the exception of containing a water tank) to the hight of 25 feet 6 inches above high water springs. At this level will commence the side walls with a thickness of 8 feet 6 inches, diminishing to 2 feet 3 inches at the top. The tower will contain nine apartments, each 10 feet in hight, in addition to the lantern, the seven uppermost being 14 feet in diameter. The estimated cost is £78,000.

A Dangerous Enterprise.—A great engineering work, now in course of execution is the lighthouse of Ar-nien, on a rock beyond the Isle of Sein, off Cape Finistorre, (Land's End), Brittany, western France. In 1860 a commission was appointed to inquire into the possibility of constructing a lighthouse at this point, where the currents were so tremendous that even in the calmest weather they cause a very heavy sea in certain directions of the wind. The rock is of hard gneiss, from 40 to 50 feet in length and about 25 in breadth. The preliminary work was done by fishermen of the Isle of Sein, whose familiarity with these waters enable them to reach the rock when no one else could. Their method was, when opportunity offered, for two of them, wearing cork belts, to get out of their boats and lie upon the rock, which they clutched with one hand, while they made holes at intervals of three feet with the other. Meanwhile they were covered with spray, and sometimes carried away to be recovered by a boat. In 1867 only eight hours' work could be accomplished, and 15 holes made; the next year 40 holes were made. In 1869 the building was begun, and now the tower is 40 feet above the highest tides, but it is intended to be about 90 feet.—*Manufacturer and Builder.*

The Speed of Screw Steamers.—It is generally supposed that the builders of steam vessels have so mastered the principles of their art that they can predict to a nicety what speed a given vessel will have when driven by an engine of a certain horse-power. A recent instance in England shows that this is far from being true. A twin screw vessel in the British navy, the *Iris*, was built for great speed. Mr. Froude, who is considered the best authority in the world, predicted that it could be driven at 17.5 knots per hour with 7,000-horse-power. His calculations were checked by the admiralty and found correct. At the trial her engines indicated 7,503-horse-power, but the speed was only 16.577 knots. The screws were then changed, and the speed attained was 18.573 knots, or more than a knot faster than was expected. Here were two distinct errors. The *Engineer* concludes from these trials that very little is known accurately concerning the action of screw propellers, even by such men as Mr. Froude and Mr. Barnaby, chief naval constructor of the admiralty.

Rendering Arches and Tunnels Waterproof.—A composition formed by the admixture of about equal parts of coal-tar pitch, Archangel pitch, Stockholm tar, cotton seed oil, anthracine oil, and resin is proposed by Mr. Hamor Lockword, of Manchester, for rendering arches, tunnels, etc., impervious to water. The composition being well mixed and heated, a coating of the same about one-half inch thick is first laid on the top of the arch or bridge, and then a light coating of varnish applied hot, followed by a layer of brattice cloth, then another coat of varnish, and next a layer of roofing felt, and a third coat of varnish, after which he applies a second coat of brattice cloth, and finishes off with a one-half inch coating of the first-named mixture or composition.

Useful Information.

Spontaneous Combustion of Coal on Vessels.

The falling off in the demand for English coal has had one salutary result, and that is, it has seemingly put a stop to the destruction by spontaneous combustion of coal vessels. Four or five years ago the number of large ships annually destroyed in this way was alarmingly great. In 1873, there were 23 ships, out of those which sailed from Great Britain laden with coal, which were lost by the spontaneous breaking out of fire in their cargoes. In 1874, the number of cases of fire was increased to 50; and it is now thought that if the domestic demand for coal had not then begun to fall off, the loss of vessel property in the succeeding years would have been even more serious. As it was, this period of destruction ended almost as quickly as it began. In 1875, the number of losses was relatively small; and for a year or two past, although vast quantities of coal are annually shipped from Cardiff and Newcastle to South America and the East Indies, we believe there has not been a single case reported of spontaneous combustion in a vessel's cargo. This sudden change goes far to substantiate the theory put forward, four years ago, by Mr. R. Cooper Rundell, an English scientist. It had been claimed that these fires were due to imperfect systems of ventilation, and also to the fact that the coal had been wet with rain before it was put into the ship's hold. The trouble with this line of argument, as Mr. Rundell pointed out, was that it did not explain the reason for the previous non-occurrence of fires. The methods of ventilation and the average of rainfall remained tolerably uniform; but in one year two coal ships were destroyed, and in another 50 cargoes took fire. The cause, therefore, would seem to lie outside of these two conditions, and Mr. Rundell traced it to the very large quantity of small coal which at that time, in the excessive pressure of business, was taken from the mines and hurried in a damp state on board of the vessels. The article was then in so much demand that it was useless to object to the inferior quality of the coal furnished, or to expect that before being delivered it would be dried by exposure to the sun. The shippers had to take what they could get, and as a consequence of this indiscriminate loading, millions of dollars worth of shipping property was destroyed. At present the coal purchased for shipment is taken from large heaps that have been exposed to the drying action of the atmosphere and has been carefully screened, so as to exclude the finer particles which the high prices of five years ago allowed the miner to dispose of as merchantable.—*Iron Age.*

Electrical Manifestations at Vale Colliery.

Recently discovered developments of electricity in the large boilers in connection with the coal-raising apparatus of the Vale Company's works are thus recorded in the Halifax *Herald:*

On placing the hand or any part of the body near the boiler door or safety valve, it received a severe shock from the same, and sparks might be distinctly seen passing from the boiler, etc., to the part of the body nearest to it.

On further experimenting with the same, it was found that it was necessary to be in close proximity to the boiler to receive the electric shock, but when standing in the current of steam escaping from the safety valve, severer shocks were experienced, and vivid lights beheld between the party standing in the current of steam and others standing in close proximity. Also, a party standing in the steam, holding a piece of steel, iron, or any other conductor of electricity perceived that various steady currents of electricity were produced. It was further noticed that when any person held his hand in the steam, the electric sparks were clearly seen passing from the finger ends of the other hand; or when a person placed himself in the steam, it was noticed that he became so charged with electricity that it might be clearly seen from every hair-end on his head, and on coming out from the steam, he would communicate a shock to any party whom he might touch.

It may be further stated that in placing any conductor in the steam the electric current was seen as vividly as in the other cases. Since the above was discovered at the Vale, something of the same nature was produced at the Albion mines.

It is the opinion that the electric current is generated from the steam under friction, as the spark is seen at any point where there is a leak; but whether it is caused by the mineral water from the mine, or at the expense of the boilers themselves, is not known.

Another Narcotic Plant.—Major Stuart, writing from Port au Prince, notices a plant growing there of such strong narcotic power that, in the hands of a skillful practitioner it will produce coma of any intensity or duration, or even death itself when so intended. The knowledge of this plant, he says, is confined to a few families, who transmit the secret as an heirloom from generation to generation, and the heritage is highly valued, confirming, it is thought the power of miracle-workers and priests—for the plant is in many ways used in aid of solemn imposture, superstition and crime. The power thus exercised is called "wanga," a word that inspires the African with awe and dread. The wanga priest can throw into a death like coma, and knowing the moment of consciousness returning, he will make a show of recalling to life, or, if a burglary is to be committed, he can, by means of his art, cast a deep sleep on his victims. Major Stuart thinks that this plant would prove a valuable acquisition to medical science.

A Native Alloy of Copper and Zinc.—A correspondent of the *Mining Record* gives the following data on a native alloy of copper and zinc sent by S. H. Hill of Downieville, Cal.: The specimens examined were in the form of small, somewhat flattened, concretionary masses, from three-quarters to one-quarter centimeters in diameter, and without apparent crystalline structure. Color from dark reddish brown to yellowish white, streak faint yellowish white slightly incrusted with green carbonate of copper; somewhat brittle, specific gravity of one specimen, 8.33. An analysis of this sample by Dr. T. B. Stillman gave: copper, 85.02%; zinc, 11.02%; antimony, 2.82 %; iron, .09%; total, 99.95%. These specimens were found, according to Mr. Hill, in the ravines along the south fork of the North Yuba river, in Sierra county, California. These ravines have for years been worked for gold, which is still found in paying quantities, associated with silver, native copper, zincblende and galena.

Why Glass is Broken by Hot Water.—No person could be so foolish as to hazard the breaking of a glass by pouring hot water upon it, if he understood the simple means of accounting for the breakage. If hot water is poured into a glass with a round bottom, the expension produced by the heat of the water will cause the bottom of the glass to enlarge, while the sides, which are not heated, retain their former dimensions, and, consequently, if the heat be sufficiently intense, the bottom will be forced from the sides, and a crack or flaw will surround that part of the glass by which the sides are united to the bottom. If, however, the glass is wetted with a little warm water, so that the whole is gradually heated and thereby expanded, boiling water can then be poured in without damage. If a silver spoon is placed in a goblet or glass jar, boiling water can then be poured in without danger, unless the article has been taken from a frosty closet and is very cold.

Good Health.

How to Bathe.

Editors Press:—"The summer now is here;" pleasure seekers and holiday makers are "come, come, coming" to the cool, quiet seaside. Many, I notice, are ignorant of the first principles of bathing, although anxious to derive benefit from a "dip in the briny." Let me, for the profit of such, give a few bathing axioms.

Don't bathe at all if you feel chilly. Don't loiter, semi-nude, at the margin of the sand, letting "I dare not wait upon I would." Once undressed, rush into the water; or, better still, if practicable, dive in head first.

If you can't dive in, wet your head as soon as possible, either by splashing water over it or dipping under the surface. Ladies afraid of wetting their hair had better refrain from bathing, as dry-head bathing is neither pleasant nor beneficial, and induces headache and other unpleasant results.

Let your first bath be just a dip in and out again. Make each succeeding bath a little longer until a maximum of 15 minutes is reached. Keep in motion all the time you are in the water, either swimming or splashing about.

To have a really enjoyable bath, find a retired spot and bathe in your skin; "costumes" are a nuisance. Have a big Turkish towel, one and a half yards long and a yard wide, and scour yourself till you're as red as a lobster. Dress quickly, and go punish the hash.

Edw. Berwick.

Monterey, Cal.

Trichinosis.

The above disease is caused by eating diseased pork, or pork affected by a small microscopic animal existing in the flesh of pork. Generally encysted in the pork, the human stomach sets the animalcule free, which speedily reproduces myriads of its species, and penetrating into the blood is carried by the capillaries into every part of the body. It has been said that there is no remedy for this dreadful disease, which causes intense agony in the subject, and death in a short time. Careful experiments show that when pork is thoroughly cooked, every part being exposed to the temperature of 212°, or boiling heat, the trichinæ are destroyed and the meat may be eaten with impunity. Care should be exercised in the eating of raw smoked pork, such as ham, bacon or Bologna sausage, as there is no means of determining whether the pork is diseased or not, from its general appearance, and several days elapse after the pork is taken into the human stomach before the effects are perceived. Good clean-fed hogs are generally free from trichinæ, while unclean, promiscuous feeders, especially carniverous hogs, are apt to be affected. Rabbits and rats are also sometimes affected. Man alone suffers death from the disease. The animals affected by it do not show any symptoms. The microscope is the only means of detecting the condition of the pork.

The following remedy is given in the *American Medical Bi-Weekly:* Dr. Rhode, in the *Berlin Klin. Wochenschrift*, states that he accidentally discovered that the free administration of ergot, especially of ergotin hypodermically, is a speedy and positive curative agent in trichinosis. In one case eight grammes of ergotin effected a speedy cure.

Color Blindness.

At the annual meeting of the Pennsylvania State Medical Society recently, Dr. P. D. Keyser, of the Wills hospital, Philadelphia, reported that he had examined as to color blindness a large number of trainmen on different roads. He found that of those examined 3½% mistook colors one for the other, their defects being of such character as to make them really incapable of filling their positions with safety. There were 8½% additional who, although able to distinguish colors, were unable to tell the various shades, thus making 12% of those examined who were not able to distinguish shades and colors quickly and sharply. Another physician, as the result of extended examination, points out dangers the traveling public undergo through the prevalence of color blindness. Dr. Jefferies, of Boston, has examined the eyes of 24,000 persons. He finds the proportion of those who are unfit to perform railroad or steamboat service to be about the same as was discovered by Dr. Keyser—3½%. That is more than 3 out of every 100 of engineers, conductors and brakemen who control our swift-flying trains cannot distinguish the red light from the green! There is reason in Dr. Jefferies' suggestion that every railroad employee be compelled to submit to au examination as to his ability to discriminate colors before he is allowed to take his post.

A Remedy.

La France Medicale states that M. Delbœuf has found that if a person afflicted with Daltonism looks through a layer of fuchsine in solution, his infirmity disappears. A practical application of this discovery has been made by M. Joval, by interposing between two glasses a thin layer of gelatine previously tinted with fuchsine. By regarding objects through such a medium all the difficulties of color blindness are said to be corrected.—*Chemical Review.*

Respiration Affected by Food.—A very careful examination by Dr. Speck, of the changes produced in the respiratory process by the use of fatty food, of coffee, quinine, alcohol and water, and by the inspiration of air respectively rich in carbonic acid, poor in oxygen and rich in oxygen, has led him to the following conclusions: With an increased proportion of hydrogen in diet, the amount of air inspired and expired decreases, and nutriments, such as sugar, which contain little hydrogen in comparison with their oxygen, involve more exertion of the respiratory organs than such as are rich in hydrogen, like the fats; the more carbon predominates in the food, in proportion to hydrogen, the more air is exhaled in proportion to that inhaled, the more carbon increases in the diet in proportion to hydrogen, the more carbonic acid is evolved and the more oxygen is taken up—while the richer the diet in hydrogen the less oxygen is required. An atmosphere containing 5% or 6% of carbonic acid could be breathed for some minutes without oppression; at 11.51% great exertion was needed to breathe for one minute; at 7.2 all the carbonic acid produced in the body is retained in the blood.

Poisoning by Mushrooms.—J. A. Palmer states that there are three different ways in which mushrooms may act as a poison. First, they may produce theeffects of indigestible matter, as when the hard coriaceous species is eaten; and even the edible mushroom may cause a similar result, for when it is decomposing it gives off sulphureted hydrogen gas in quantity sufficient to cause vomiting. Second, mushrooms may be gelatinous or acrid. Third, a subtle alkaloid, without smell or taste, is contained in some mushrooms, as, for instance, in the group of the Amanitæ, and is called amanitin. No antidote has yet been discovered for this poison, and to it most of the cases of death following the eating of mushrooms is due. It is at first slow in its action, but after the lapse of eight to fifteen hours the patient experiences stupefaction, nausea and diarrhea. Delirium follows, and then death. Mushrooms containing amaaitin will impart poisonous properties to wholesome varieties if both happen to be placed in the same vessel. The poison can be absorbed by the pores of the skin. Mr. Palmer carried in his hand amanitæ wrapped up in paper, and notwithstanding the protection which the paper should have afforded, he was seized with alarming symptoms

Cooked Food.—There is probably less observance of the laws of health in the cooking of food than in anything else. In order that food should properly assimilate with the blood and nourish the system, meat should be cooked so as to preserve all of the animal juices, and vegetables never over-cooked. Over-cooked meat is no more nourishing than woody fiber; while over-cooked vegetables are putrefactive.

The Week.

The mining interests of the coast do not show any deterioration, the imagination building up a glittering delusive future upon speculative interests, and paper wealth, overlooks the practical character of our mines. Rich strikes and discoveries taken with a grain of salt, indicate favorable prospects, while the diminution in bullion and assessments levied, show that capital is absolutely necessary to develop fully our mineral wealth. The over-crowded condition of new mining regions, the low wages and high living attending a rush, should be a warning to practice moderation. There is room for capital and we could safely quadruple the output of gold and silver without disturbing the world's demand. The falling off this year from last is estimated at 20% to 30%. The world can use an annual product of $300,000,000 now, while the total product is $160,000,000 short of the demand. Our mines could help to fill this gap, if the mining business were confined to the legitimate as distinguished from the purely speculative.

Coal Gas and Electric Lights.—M. Hippolyte Fontaine, an accomplished electrician and the director and proprietor of the *Revue Industrielle*, has just published a second edition of his "Electric Lights." In his preface, M. Fontaine does not hesitate to declare that coal gas has nothing to fear from electricity as an illuminator, despite the competition likely to ensue between these two systems of illumination, whether public or private, and adds: "The manufacture of coal gas will never be interfered with by electricity. Electricity will never replace gas, lamps, or even candles. It does not and cannot create a revolution in means of illumination, or destroy what exists or monopolize all of the industrial, public and private applications of light. The electric light has its own particular place in the midst of a crowd of indispensable utilities, but far from diminishing the consumption of other means of illumination, it will cause their more perfect development by increasing the demand for a perfect illumination in quantity as well as in quality.

Crooked Ways in Mining.

Mining companies when organizing have the bad habit of fixing their capital stock at figures grossly disproportionate to the value of the properties ostensibly represented by such stock. This is a practice that for various reasons calls for abatement. In the first place it is dishonest. It is a false pretence. These companies are not the owners of any such values as this system of over-capitalization implies. Nor are these big figures a mere harmless fiction, as many suppose. If not intended for dishonest purposes they are used to that end. In practice they become implements of deception and fraud. To illustrate, a party owning a mining claim organizes a company, incorporates the same with, say a nominal capital stock of a million dollars, divided into a hundred thousand shares of the par value of ten dollars each, which shares are issued to the several members of the company. Such procedure, including necessary books, etc., costs but a trifle. This mining claim may be but little developed, may, in fact be wholly worthless, and yet it will be possible for the holders of these shares to work off a great many of them on the public. We say it will be possible because there is a large class of men who for the past 20 years have depended for a subsistence mainly upon this sort of traffic. With their pockets filled with this rubbish they have managed to work their way comfortably through the world, effecting purchases and paying their debts with it wherever they could strike a simple tradesman or a helpless creditor. Half the men one sees around the purlieus of the stock house eke out a precarious livelihood through the aid of these mining shares. They pay for their washing, lodging and their other small bills with them, and, in short, shove them off wherever they can, though morally it is no better than paying with counterfeit bills or bogus coin. This is one of the small ways in which this over-capitalizing of mining stocks becomes damaging and reprehensible.

But this style of inflation if persevered in must eventually work serious harm to our mining interests abroad, as no thoughtful business man will invest his money in securities so devoid of solid backing. What sense is there in placing a valuation upon a property ten times greater than any capitalist would ever think of paying for it? A better plan would be to commence with a capital stock that fairly represents the worth of the mine, and then increasing it as the latter appreciated in value, should it ever do so. But this method has, in some instances at least, actually been reversed; companies increasing their capital as their mines became impoverished. The ores in the Bonanza mines began to show signs of depletion at the time the management more than quadrupled their shares. The nominal capital of the various companies owning mines on the main Comstock range, to say nothing of lateral claims, aggregates over $500,000,000, yet where could a syndicate be raised that would pay for these properties, 20% of this appraisement? We are sorry to see that this practice, so long prevalent on the Comstock, is finding repetition in Bodie, Utah and Colorado, where a number of mining companies have lately been organized with capitals ranging from ten to twenty million dollars, and this, though their mines have in some instances, been but little opened and afford as yet, no evidence of large value.

Akin to this plan of over stocking mines at the start or watering their shares afterwards, is that of consolidating various interests, or rather the pretence of effecting some sort of consolidation and under color thereof increasing the capital of the company, though they have in no wise increased their property in extent or value. This thing has been largely practiced in the Bodie district of late, where several of the leading companies have been doubling up their capital stock and number of shares, and taking on a prefix indicative of a concentration of interests or an aggregation of properties where none has actually taken place.

What we have to complain of in these cases is the bad faith they imply, and which in almost any other business would be looked upon as a taint of fraud. It is this loading down mining with so many crooked practices that has given rise to the question whether or not it is a legitimate business. As Prof. Clayton has so aptly remarked, mining for the precious metals is a legitimate business to those who make it so; but what calling could hope to escape these imputations by innuendo were it oppressed with so many dead weights, and so beset with leeches on every side? It is no justification of these abuses to say they are practiced in other pursuits as well as in this; nor is it true that they so generally prevail in other branches of business. Railroad incorporations do not over-capitalize like mining companies at the start, and if they afterwards water their stocks it is not done when their earnings are likely to suffer decline or be extinguished altogether. If these or other industrial institutions consolidate the act is apt to be attended by some increment of property, muniments or other forms of wealth, their operations and effects being always open to inspection, and not like those of mining companies deeply buried up or susceptible of easy concealment from the world.

The professional gambler does not pursue his calling on the public thoroughfares, nor is he permitted to open an office in the respectable and much frequented portions of the town. Those who wish to play must seek him out and themselves inaugurate the game. He does not invade the domestic circles and urge the inmates, even the mother and servant girl, to stake their money on the turn of a card. He does not stand at the street corners, and with deception and lies try to shove off a lot of worthless mining shares on a confiding acquaintance, nor seek to pay his room rent and board bill with this sort of rubbish—in all of which he differs from the ordinary stock sharp and dealer in wild cat mining scrip, who with an equal dislike of honest work, lacks, still, the honorable instincts of the professional gambler.

We believe mining to be a useful industry. We know it can stand on its own merits. The practices on which we have been animadverting are foreign to the business. They are prejudicial and hurtful to it. They have brought it into bad repute, and we feel constrained to protest against their further continuance. Any calling that requires auxiliaries of this kind had better perish.

Statements about California Mining.

In the New York *Sun* of recent date appears a letter on the mines of this coast from the pen of Alexander Del Mar, a writer on statistical, economic and monetary topics, and for some years past a resident of San Francisco. This letter, because of certain strictures upon the condition, prospects and management of our mines contained therein, has been widely commented upon by the newspapers of California, some of which have heartily commended while others have so earnestly condemned the same; these two sections of the press here, as is too apt to be the case with the press everywhere, having been governed each by the special interest it claims to represent. While we detect in Mr. Del Mar's letter various misstatements of facts, as well as what we believe to be some errors of opinion, it seems to contain at the same time some well presented truths coupled with a deal of wholesome advice, which the parties to whom it is particularly addressed would do well to heed.

We think this gentleman is mistaken in saying that mining for the precious metals can no longer be profitably carried on with free labor, for the reason that gold and silver of modern production cannot compete with the large stock of these metals already on hand, being the product of the much cheaper labor of former times. Overlooking the fact that this competition is altogether fanciful, the answer to the above objection is, that the advantages gained through the employment of improved motors and machinery for prosecuting the business of mining more than compensate for the cheaper labor of ancient times. Fourteen thousand mules and twice as many peons were formerly maintained in a single mining district in Mexico to perform a service that could be better accomplished by half a dozen of the more powerful steam engines now in use on the Comstock lode.

The statement in this letter to the *Sun* that the hydraulic miners of California think it worth while to wash a cubic yard of gravel for the one cent's worth of gold it contains must, of course, be accepted in a comparative sense, and, as merely expressing the writer's idea of the unprofitable character of this business, inasmuch as the value of the gold obtained from the hydraulic washings averages fully 20 cents to the cubic yard.

The cautions thrown out by Mr. Del Mar against investing in the shares of mines listed on the New York Boards are neither so foolish or untimely as some may suppose. Properties liable to fluctuate in their market values as some of our mining shares have done, must be very dangerous securities for the stranger to deal in. Take, for example, the history of half a dozen of the principal mines on the Comstock belt, tracing the same back no more than seven or eight years. In the fall of 1870 their aggregate value, as measured by current quotations, was scarcely $5,000,000. In January, 1875, this value had risen to $270,000,000, and in a little more than two years after had fallen again to $10,000,000. In another year it advanced again to $30,000,000, and within four months thereafter jumped up to $125,000,000, since which time it has again dwindled to an insignificant sum, only two of these mines having been able during the interim to show any considerable body of good ores, and both of these towards the last having undergone great deterioration. How can Mr. Del Mar, or any one else, too strongly deprecate investments in properties like these! It is sheer nonsense to affect to criticise the writer who characterizes this class of operations as the fraud that they are. Better thank him, as one caring for the welfare of the inexperienced, and laboring in the interest of legitimate mining.

In Mono County.—Mr. J. H. Wheeler is now on his way to Mono county to present the claims of the Press, and to secure trustworthy data for descriptive articles on the condition and prospects of mining in this famous district. We trust he may be aided in his work by all those whom he may approach.

The will of Baron de Rothschild disposes of personalty amounting to £2,700,000.

Nature of the Inner Earth.

The nature of the inner earth appeals to a circle of inquirers far outside the pale of the special sciences, whether the earth is a hollow shell containing molten matter, or compressed gas, or has a solid crust and nucleus separated by an intermediate layer of liquid, each has its advocates, and is supported by arguments of more or less weight. During a visit to Vesuvius last May, Herr Siemens, to explain the phenomena which he witnessed, was driven to the conclusion that hydrogen gas, or its combustible compounds, rise from below, and, mingling with atmospheric oxygen, form an explosive mixture which is burnt in the upper part of the volcanic chimney.

By continued cooling of the molten globe, a separation of its components would probably occur, according to their relative weights. The igneous liquid would not be homogeneous throughout. Those compounds which were specifically heavier would be attracted toward the interior of the viscous sphere, while the less dense substances might remain nearer to the outside; thus, the acid silicates might be separated from, and float upon the denser basic silicates.

Whether the solidification would commence at the outside or at the center of the refrigerating globe, is the point of argument. If a mass of molten metal be allowed to cool, a crust soon forms over the surface, while the interior may remain for some time in a liquid state, and, hence, it is natural to argue that we live upon the crust of a sphere which contains a mass of molten matter.

It is now 30 years since Prof. James Thomson announced the theory that if a body expand during solidification, its melting point must be lowered by pressure. A theory afterward confirmed experimentally by his brother, now Sir William Thomson, who showed that the melting point of ice was lowered in the way suggested; pointing out at the same time that if the substance contracted during solidification, its melting point ought to be raised—a prediction confirmed by the experiments of the late Mr. Hopkins, of Cambridge, whose investigation extended to such substances as wax and stearine, sulphur and spermaceti. It is clear, therefore, that in such a case, pressure and heat directly oppose each other; the former tending to prevent, and the latter tending to promote fusion. Supposing that the surface of the cooling globe were locally solidified, the solid portions might be again fused as they descended to regions of higher temperature, and the globe might thus be kept in a liquid condition until it became sufficiently viscous to prevent the subsidence of the solidified portions, when a solid crust would permanently form on the exterior, enclosing a fluid mass within. But if the solidified portions, as they sank in the molten mass, had their fusing point greatly raised by the increased pressure to which they were subjected, then it is possible that they might retain their solid condition, even at the very center of the globe, and thus the process of solidification would gradually tend outward, until a solid or nearly solid spheroid was ultimately produced.

All depends, however, upon the question whether the molten rock would contract on solidification, and, if so, to what extent. Bischof's experiment went to show that solid rocks are about 20% denser than in a molten state. Mr. Mallet's experiments on blast-furnace slags show, however, that these silicates contract only about 6% during solidification. Herr Siemens found that if glass be perfectly fused to a thin liquid and be then allowed to cool, it rapidly contracts until it acquires a plastic or viscous condition; but on further cooling the contraction is greatly diminished; until at the moment of solidification a slight expansion occurs, and hence Herr Siemens concludes that the experiments of Thomson and Bischof prove, not that the earth in consequence of pressure is solid to its center, but simply that the interior has become plastic or viscous, and upon no other hypothesis can the formation of the many thousand feet of alternating sedimentary deposits which are spread over the surface of the earth be accounted for. Upon the plastic hypothesis may be explained the great elevation of many continental areas, and the gradual upheavals and depressions of large tracts of country at the present day. The difference in height between the plateau of Central Asia and the bottom of the Pacific ocean is at least 12,000 meters, representing a difference of pressure on the viscous matter of about 1,000 atmospheres, whence the rocks which form the floor of the ocean, must, of course, be denser than the others in order to attain the requisite hydrostatic equilibrium. Archdeacon Pratt, remarking upon the attractive action of the Himalayas upon the plumb line, says: "The density of the crust beneath the mountains must be less than that below the plains, and still less than that below the ocean bed." The Astronomer Royal, in a popular lecture last year, at Cockermouth, expressed himself in similar terms: "If one might presume on such a point, I should say that the high parts of the earth are made of something light. The heavy dense parts are those covered by considerable quantities of water, and they have sunk deep in the center of lava, in which I conceive all things to be resting." And Sir George Airy adds the great weight of his authority to the view that the center of the earth is still fluid.

A Pacific Coast Harbor of Refuge.

The peculiar configuration of the Pacific coast lins of Lower California, California, Oregon and Washington Territory is such that there are very few indentations affording harbor facilities in the whole length. Between San Diego, at the southern boundary of California, and the Strait of Fuca in Washington, a distance of some 1,300 miles, there are really only two good harbors accessible at all times—San Diego and San Francisco. There are a few others which are good when ones inside, but they are bar harbors, difficult of access in stormy weather. A large proportion of the landing places are mere roadsteads partially protected from the summer winds by projecting headlands, but open to the southerly gales of the winter months. Between San Francisco and San Diego most of the trade is done by steamers, and to the more important points north of this place steamer connection is made. There is, however, a very large fleet of sailing vessels in the coasting trade, carrying produce, lumber and coal. The bulk of this trade is to the north of San Francisco, to the lumber and coal regions, our northern coast line being especially rich in its lumber resources. There are 945 vessels, aggregating 243,709 tons, belonging to the port of San Francisco, and of this number, 467 are schooners engaged in the coasting trade.

Most of the northern coast trade is done at "chute" landings, as they are called, a loading system necessary from the ruggedness of the coast line. These chutes consist of a long incline of wood in the form of a shallow trough, extending from a headland of a shipping point, or from a high wharf or pier, out to a point where the water is deep enough to allow vessels to come under and load. Lumber and other articles are slid down these chutes to the vessel's deck, the vessel meantime being moored head and stern and tied up strongly to keep her in position. Some of these chutes are 400 or 500 feet long. The peculiar formation of the coast brings nearly all the chutes on the north sides of the landings. At some places even these cannot be used, owing to the roughness of the place. Then a wire rope is let down from the cliff, taken between the schooner's masts to a rock or buoy, and a steam engine on shore lowers the material down the rope to the vessel.

A great many wrecks occur in winter on this coast from the lack of harbors, as in bad weather vessels have to be at sea and take it as it comes, with no place to run to. The roadsteads are untenable and the bar harbors inaccessible. A harbor of refuge has therefore become an absolute necessity, and steps have been taken by the Government to construct one. Congress has appropriated $150,000 for the commencement of the work, which will cost some $8,000,000 or $10,000,000 to complete. It will be the largest operation ever undertaken on this coast by either private corporations or the Government.

It has been decided to have this artificial harbor at some point on the coast north of San Francisco, between it and the Strait of Fuca, a distance of 700 miles; between which two points there is not a single place accessible at all times. The United States Board of Engineers, under instructions, examined Drake's bay, Mendocino City, Shelter cove, Humboldt bay, Trinidad harbor, Crescent City, Macks' arch, Port Orford, and Cape Gregory to see which place afforded the best facilities. After the examination they reported on the cost of all, giving preference to Trinidad harbor, an engraving of which we herewith present, showing the configuration of the harbor and the lines of a proposed breakwater, as designed by the board.

Trinidad bay is about 17 miles above Humboldt bay and 31 miles north of Cape Mendocino, on the right between that point and Pt. St. George, being about midway between San Francisco and the Columbia river, the two principal commercial and shipping ports on the Pacific coast. Cape Mendocino extends some 15 miles to the westward of it, so the harbor is in a curve of the coast line somewhat protected from winter storms by the formation of the land. In such bights or indentations on the coast the storms and seas are not so severe as they are at the capes and points lying further to the westward.

The approach to the harbor is uninterrupted, and there are no broken rocks or shoals. The headland is 380 feet high and 60 acres in extent. It already belongs to the Government, so no money will be required to buy the land. There is also a lighthouse there now. The headland is formed of hard metamorphic sandstone, furnishing material suitable for the construction of a wall. The first section of breakwater from the head outwards will cost, according to the estimates of the engineers, $3,076,000. The two sections, or whole breakwater, will cost $7,694,000. It will take over seven years to build the first section, and between 17 and 18 years to build the whole, on the supposition that 1,000 tons of stone per day can be put in position each working day in the year. This will give some idea of the magnitude of the proposed work.

Of course where so much money is to be spent there is considerable rivalry as to point of location. The engineers, desiring further information, invited all persons interested to come before them and explain the advantages of their respective localities. This conference has drawn out very many conflicting opinions from ship masters and others. It is probable, however, that the choice will be between Trinidad and Port Orford. The engineers, with the new facts before them, will next month make another and more searching examination, and report finally. The breakwater at Port Orford will cost $10,507,000, the depth of water increasing the cost. The engineers may see fit to change their opinions on further examination, but the final choice rests with them, they taking all questions of geographical position, natural facilities, cost, etc., into consideration.

TRINIDAD BAY, CALIFORNIA—SHOWING LINES OF PROPOSED BREAKWATER FOR HARBOR OF REFUGE.

"American Antiquarian."—We acknowledge receipt of the "American Antiquarian," published at Chicago, Ill., under the editorial charge of Rev. Stephen D. Peet, and in a future issue will refer more at length to its interesting contents.

Senator Blaine has written a letter to New York merchants on the decay of American commerce and the means of promoting its revival.

Sites of Especial Mining Activity.

In glancing over the mineral districts of California, mining affairs seem to be in a rather apathetic condition in all that part of the State lying south of Mono and Mariposa counties. Throughout that extensive region little has transpired of late in connection with the business of mining calling for special notice, either as regards new discoveries, progress made or openings presented for investment. In the Julian and Banner districts, San Diego county, at Silverado, in Los Angeles, and at a number of points in Inyo, Kern and Fresno counties work has been kept up with some show of activity, but elsewhere in this section of the State mining operations languish, having suffered contraction rather than expansion during the past two or three years.

Of all our quartz mining centers the Bodie district, in Mono county, presents just now the most animated as well as the most hopeful and prosperous locality, and there is scarcely a doubt but several of the mines here are really properties of very great value. On this point the affirmative testimony is strong and quite unanimous. Of the many experts and practical miners who have visited the district within the past month, none have expressed other than a high opinion of the ore bodies developed in the Standard and Bodie mines, some of these parties avowing the belief that the Standard find is second only in importance to the bonanza strike on the Comstock lode. I. M. Taylor, who has just returned from a visit to these mines, made in the interest of New York investors, tells us that he does not think the accounts given of them by either visitors or the local press have been at all exaggerated. He made careful measurements of the Standard exploitations and ore reserves, which latter he considers ample to keep the company's 20-stamp mill running steadily for the next three years, the profits in sight amounting to more than the entire property is selling for on the New York board, rating the stock at $36 per share. Aside from established reserves the ore bodies developed point to continuity in depth with a likelihood of others being opened in virgin ground. The ores are exclusively gold-bearing, and so free from contumacious elements that they surrender 90% of the precious metal they contain under the most cheap and simple treatment in use. They are sent to mill without assorting, and yield an average of $90 per ton, the results of downward exploration tending to a higher grade. That this district opens an inviting field for investment it is needless to say.

Coming north into Alpine county, still east of the Sierra, we find that the prospects of the few miners left here have undergone some improvement of late, the outlook in the Monitor district being very much better than ever before. Crossing the mountains several active camps on the main auriferous quartz belt arrest attention. First we have the group of mines belonging to the Boudsretta, the Martin & Walling, and the Boudurant Gold Mining and Reduction Companies, with the Furguson, the Eureka, the Pino Blanco, and other well known properties in the neighborhood, and the Hite mine not far distant. These mines are situated in Mariposa county, and several of them are making large and profitable productions of bullion, being thoroughly developed and well outfitted with hoisting and reduction works. On the property of the Bondurant company, elsewhere more fully described in our present issue, operations of an extensive kind have recently been commenced, some of the other companies mentioned having also added largely to their working force, affairs in the whole district moving now with a vigor never before experienced.

About Groveland, in Tuolumne county, new life has in like manner been infused into mining operations through the ore developments being made in the Spring mine at that place. In Amador county quartz mining was never in a more active or prosperous condition than at present. Throughout that section of the mother lode that extends from Jackson to Plymouth, including along it the Kennedy, the Oneida, the Keystone, the Potosi, the Eureka, the several Amadors and other mines, this new movement amounts to almost a revolution. Many of our most shrewd and wealthy operators have lately embarked largely of their means in this historic field where so many fortunes have been made or vastly improved. In the vicinity of Grass Valley, the cradle of quartz mining in California, this interest continues to grow steadily, though attended with less stir than in the several localities above mentioned. At that place, the Idaho mine, through a late strike made in its lower levels, takes a new lease of life, carrying joy to the share holders and encouragement to the business generally.

While a general activity is manifested in all of the localities mentioned, it must, nevertheless, be confessed that a larger investment of capital would develop the resources of each to a much greater extent than can be done solely by unassisted efforts. There are many opportunities for investment in established mines which might, perhaps, be more commendable than experimenting in new localities. Dissatisfaction with a paying strike, and a desire to reach a bonanza, cannot be too strongly condemned, as it leads to failure in accomplishing the results sought for. Continued application in the development of any particular mine cannot fail to produce beneficial results, although not so rapidly—yet they will be in the end more permanent.

Industrial Arts.—A publication which will give information of most valuable and practical character is "Spon's Encyclopedia of Industrial Arts, Manufacturing and Commercial Products." The work is published by E. & F. N. Spon, of London and New York, the well-known publishers of scientific books. Their encyclopedia will be issued in about 30 monthly parts, and will cover a wide range of industrial arts and manufactures. Number four of the series we now have before us. It has a most elaborate illustrated article on alcohol and its manufacture from all substances. Also begins an exhaustive review of the nature and manufacture of alkalies. The plan of the work is to secure articles on the special industries by men practically engaged or interested in them, and thus the treatment may be relied upon as fresh, pertinent and practical. This work should find its way into all libraries, for it will be invaluable as a book of reference,

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the License of thie Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradise Valley, Jefferson, Leopard, Eagle, Endowment, Independence.
ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.
OREGON—Monumental.
MONTANA—Alice Mine, Butte City.
MEXICO—Trinidad, Harmiguera, Plomoses.
PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

WASHING! WASHING!

Prices Reduced! Prices Reduced!

La Grande Laundry,

18th Street, Between Folsom and Howard.

PRINCIPAL OFFICE,

648 Market Street, S. F.

Office open from 7 A. M. to 9 P. M. Saturdays to 11 P. M. Washing called for and delivered to any part of the city free of charge.

All orders receive prompt attention. For circular and rice List apply at the Office,

648 Market St., San Francisco.

PALACE RESTAURANT

This elegant and spacious S. F. Restaurant has been re-opened with superior bill of fare daily, and is now the best and most popular dining saloon on this Coast.

Good Living at Reduced Prices

218 Sansome St.

[Lunch ready at 10 A. M.] Resident business men and visitors from abroad will be wise in giving this place an early call. Examine of fare and prices.

HERMAN H. HORST, Prop'r.

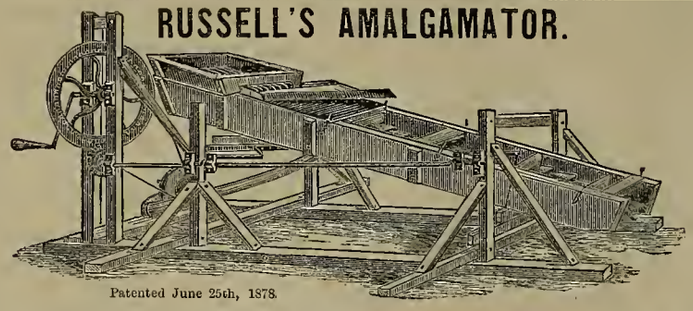
PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

AN ENGINEER,

Favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design Stationary, Marine, Locomotive, Mill Work, Sugar and Hydraulic Machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

J. MORIZIO, Gen'l Agt.,

Room 24, Safe Deposit Building, Corner Montgomery and California Streets, SAN FRANCISCO.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

STEEL CASTINGS.

From 1-4 to 10,000 lbs. Weight.

True to pattern, sound and solid, of unequaled strength, toughness and durability. An invaluable substitute for forgings or cast-iron requiring three-fold strength. Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc. 12,000 Crank Shafts of this Steel now running proved superior to wrought iron. CRANK SHAFTS, CROSSHEADS and GEARING, specialties. Circulars and Price Lists free. Address

Chester Steel Castings Co.

Works, Chester, Pennsylvania. 407 Library St., Philadelphia

PETERSON & OLSSON,

MODEL MAKERS.

INVENTORS

Will find it to their advantage to call on us at 328 BUSH STREET, bet. Montgomery and Kearny, (up-stairs,) S. F

LAND

Good land that will raise a crop every year. Over 14,000 acres for sale in lots to suit. Climate healthy. No drouths, bad floods, nor malaria. Wood and water convenient. U. S Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

COLUMBUS, OHIO.

C. L. GILLER,

SEAL ENGRAVER AND DIE SINKER,

No. 430 MONTGOMERY STREET, S. F.

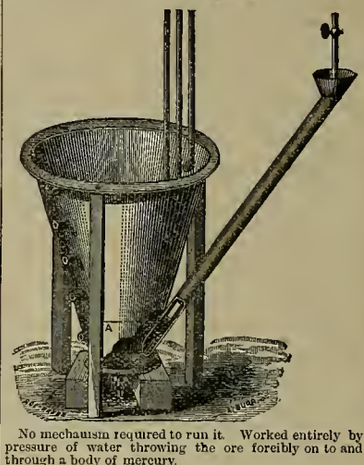
The best Work done on the most reasonable terms on the Coast.

STEVENOT'S

Fine Gold Amalgamator.

Adapted for Ores, Tailings, Slimes, Etc.

Unequaled for Cheapness, Lightness and Practical Results.



No mechanism required to run it. Worked entirely by pressure of water throwing the ore forcibly on to and through a body of mercury.

E. K. STEVENOT,

Chemist and Mining Engineer,

304 Montgomery St., San Francisco.

REPORTS MADE ON MINES. Quartz Mills, and Works of every description started.

J. S. PHILLIPS, M. E.,

Consulting Engineer & Metallurgist,

Examiner of Mines and Assayer,

702 CALIFORNIA STREET,

Author of— SAN FRANCISCO.

The Explorers', Miners' and Metallurgists' Companion, 672 pages, 33 Illustrations, (2d Edition.) Price	$ 10 50
The Prospector's "Wee Pet" Assayer, (Patented)	100 00
The Testing Machine for Gold, Silver, Lead, etc	40 00
The "Little Wonder" Self-calculating Sample and Button Weigher, (Patented)	25 00
Blow-pipists' Pocket Laboratory of Tools, Fluxes, etc.	50 00
Vest Pocket Blowpipe	3 00

CHARGES.—ASSAYING, $3; TESTING, $2 per metal.

Assaying and Testing Taught.

WANTED—$10,000.

For $10,000 cash in hand I will give a one-half interest in the BLUE JAY and ELEPHANT QUARTZ mines, situated in the French Creek Mining District, Siskiyou County, Cal. And I will take or give a lease on said mines, and pay or receive eight per cent. on the amount invested. For further particulars apply to H. C. Cory, Etna Mills, Siskiyou County, California.

C. C. Bitner's Apparatus for Obtaining Metallic Copper from its Solutions.

Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address O. C. BITNER, Spenceville, Nevada County, California.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET,

Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines; plans and reports furnished.

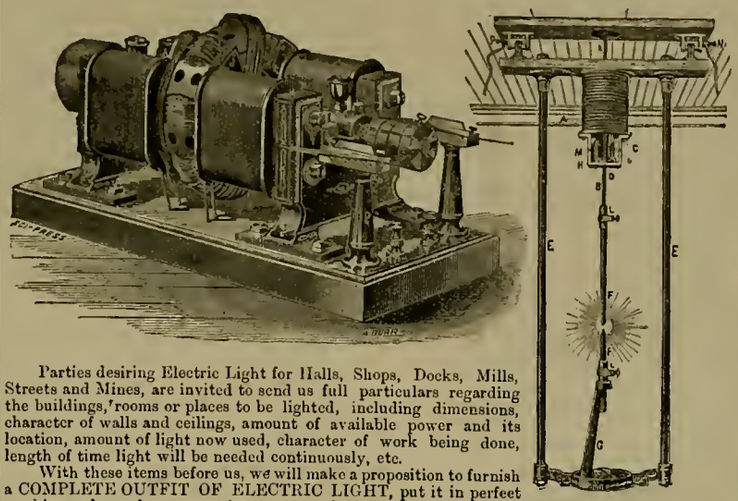
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.

With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO,

WM. KERR, President,

San Francisco, Cal.

Ingersoll Rock Drills.

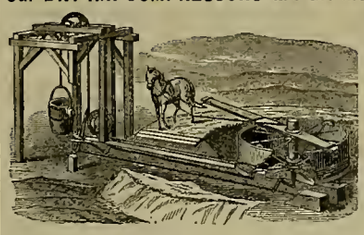
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX, 18 and 20 Fremont Street, San Francisco.

SANDERSON BROS. & CO.'S

Best Refined Cast-Steel.

Warranted Most Superior for Drills, Hammers, Etc.

A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock and for sale

At No. 417 Market St., S. F., - H. D. Morris, Agent.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

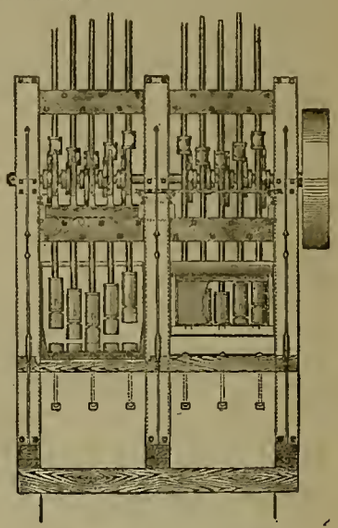
SHEET IRON PIPE.

Machinery.

GOLD AND SILVER

Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S

Wrought-Iron Frame

FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.

We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

Dewey & Co {202 San-some St.} **Patent Ag'ts**

Gas in Metallurgical Operations.

New processes in the production and utilization of hydrogen and other gases, have lately been discovered, which, if true in part only, will accomplish a revolution in the operations for deoxidizing, desulphnrizing and dephosphorizing ores, producing iron and steel, protecting all kinds of iron manufactures from corrosion, rendering them capable of resisting the action even of aqua regia, salts and alkalies.

These gases can be produced continuously and cheaply, and used for fuel in all metallurgical operations in place of solid carbon.

It is claimed that the hydrogen can be produced under a pressure of 30 to 40 pounds per square inch if desired, and can produce a heat more intense and concentrated than any other substance, capahle of reducing titanic and other refractory ores, while the affinity of hydrogen for snlphur and phosphorus as well as for oxygen removes these impurities that carbon cannot reach, and enables pure iron and steel to be manufactured from ores which by ordinary processes are worthless.

The range of the products of these processes extends from a pure hydrogen sponge to the finest quality of steel, and with soft or hard surfaces, as may be desired.

The mode of producing the hydrogen continuously and cheaply results from the discovery that iron at a red heat oxidized by superheated steam is immediately deoxidized by a small amount of naptha vapor. By passing superheated steam over iron heated to redness in a close retort hydrogen is liberated and the iron is oxidized, but the addition of a certain proportion of naptha vapor immediately restores the iron to its normal condition, and with it its capacity for producing hydrogen, and so imperceptible is the interval between the oxidation and deoxidation of the iron that the production of hydrogen is continuous without any consumption of the iron whatever.

In the Barff process for protecting iron surfaces by a coating of magnetic black oxide, produced by the action of superheated steam on iron heated from 500 to 1,000 degrees in close vessels under pressure, the iron was not uniformly coated and would scale off. In fact, this process was a failure, requiring, even for partial results, a perfectly clean surface, as in galvanizing, tinning or nickel plating. But, with the new process, the foul condition of the surface before treatment does not influence the result. The iron heated to redness is subjected to a bath of hydro-carbon vapor, which immediately reduces the oxide and leaves the surface in a condition to be acted on hy the superheated steam, no part escaping its action.

A keg of punchings completely coated with iron rust was thrown into the retort and treated without preparation. They were taken out with polished and smooth surfaces resembling graphite, and the digestion of specimens in nitro-muriatic acid for 12 hours produced no effect.

By this process, it is claimed, can be prepared metallic shingles, Russia sheet iron, fence and telegraph wires, corrugated iron roofing, nails and spikes, water and other pipes, boiler flues, boiler plates, plates for iron vessels, bridge wires, culinary utensils, in fact all surfaces, large or small, except such as aresubject to abrasion, can be fully protected, and without injury to the material.

Trinity County Mines Sold in the East.

Several of the leading New York dailies notice at some length the sale of the Buckeye Gravel Mines recently effected through our townsman, Lloyd Tevis, to parties in that city. What these papers have to say about the repnted merits of this property seems warranted by the favorable reports thereon made by eminent experts and practical miners. What the metropolitan press has to say in commendation of Mr. Tevis is equally warranted hy his history and standing in this community, where, throughout a long series of years, he has been conspicuous for the favorable issue of his many bold and varied business ventures. If in any of these ventures he has ever lost or blundered he has been wise enough to keep it to himself. So lucky has Mr. Tevis heen in all his undertakings, that we may safely predict for this mining enterprise the best results. His connection with it is an auspicious circumstance, if not a pledge, of its ultimate success; and these New York purchasers are to be congratulated on having secured a mining property so inherently valuable and so well endorsed as this Buckeye estate.

At the solicitation of parties here the Eastern investors have unanimously recommended for president of the new company Mr. E. C. Machen, who will, most likely, be chosen to fill that position. Mr. Machen is a young man of good business capacity, heing sharp, wide awake and energetic, hut careful and discreet at the same time.

The new company having ample means will proceed at once to put their mines, amongst the largest in the State, in good shape for active production. Through the retention of Mr. Tevis of a considerable interest in the property, a vigorous and economical management coupled with a generally ahle administration of affairs on this side may be counted npon. A prosperous future awaits tbe enterprise.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO.'S Mining and Scientific Press Patent Agency.]

By Spscial Dispatch from Washington. D. C.

For the Week Ending June 17th, 1879.

216,551.—Fifth Wheel for Vehicle—J. A. Bilz, Pleasanton, Cal.
216,603.—Centrifooal Pump—E. Chaquette, S. F.
216,561.—Smelting Ores—H. H. Eames, S. F.
216,562.—Hydrocarbon Vapor Burner—H. H. Eames, San Francisco.
216,564.—Amalgamator—G. R. Evans, S. F.
216,609.—Hotel Waiter—L. Garrigan, S. F.
216,670.—Sewing Machine—J. J. Graff, S. F.
216,675.—Pipe for Irrigation—E. M. Hamilton, Los Angeles, Cal.
8,758.—Fire Escape Ladder—D. Hayes and W. Free, S. F. (re-issue.)
216,634.—Stalk Cotter—J. Kraft, Downey, Cal.
216,636.—Pneumatio Dredging Tube—W. P. Lewis, Oroville, Cal.
216,691.—Railway Switch—H. A. Norton, Ward City, Nevada.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

News in Brief.

One foot of snow fell recen tly at Silver City, Idaho.

A commercial expedition to Brazil is talked of in New York.

Another Ministerial crisis is imminent in Constantinople.

Bullion in the Bank of England increased £728,000 the past week.

Eighteen persons were killed and 60 wounded in the recent riot in Sicily.

A Mrs. A. Rollann, on a wedding tour, was swept over Niagara Falls.

England and France unite in demanding the abdication of the Khedive.

The water in Frazer river has reached a hight almost unprecedented.

The Bank of Bengal has reduced its rate of discount from 7% to 6%.

Specie increased 17,775,000 francs the past week in the Bank of France.

Prince Pierre Bonaparte is lying at the point of death in Versailles.

Pietre, ex-Chamberlain of Empress Eugenie, has been elected Senator for Corsica.

It is annouuced that Tilden will run for the Governorship of New York this fall.

Specie decreased 74,000 marks in the Imperial Bank of Germany the past week.

The Khedive of Egypt declines to abdicate as demanded by France and England.

At Tracey, Minn., 300 railroad laborers and tramps are making riotous demonstrations.

Work ou the Cascades lock and canal in Oregon has been suspended for six months.

John Moore, who murdered Miss Woodward near Wellford, S. C., has been banged by a mob.

The British steamer *Thessaly*, from Havre for Bombay, has been wrecked 100 miles from Aden.

France will send three cruisers to the Pacific ocean, to protect French subjects in Chile and Peru.

John Kemmler killed his three daughters aged 6, 4 and 1 year, lately, at South Holyoke, Mass.

Louis Napoleon, Prince Imperial of France, met with death at the hands of the Zulus in South Africa.

The Receiver's office at Cherson, Russia, was recently undermined and robhed of 1,500,000 roubles.

The 93d yearly Directory of New York city shows an increase of population for the year of 43,000.

An earthquake in Sicily, Tuesday, destroyed five villages, killing 10 persons and injuriug several others.

The oldest printer in tbe United States—William E. Dean, 91 years—died in New York, Monday 17th.

A dispatch from Havana states tbat vessels are being cut out of the regular Gulf ports by quarantine.

General Negrete has sent a message of suhmission to the Mexican government, asking for clemency.

The insurrection in Algeria continues, and collisions between the troops and insurgents have occurred.

A State convention of brewers, saloon keepers and liquor dealers is to be held July 30th, at Des Moines, Ia.

It is reported from New York that considerable California capital is flowing into that city for investment.

The recall of Mahmoud Nedin Pasha has been countermanded, and the crisis in the Turkish Ministry has ended.

The master of the Spanish brig who defied the Custom-house officials at Pensacola, Fla., has been fined $700.

Gen. Sherman is at Orchard Lake, Micb., attendlng the commencement exercises of the Michigan Military Academy.

By a decision of Judge Bellinger, at Portland, Or., no more Chinese can be employed on the public streets of that city.

The ceremonies of relaying the corner-stone of the Washington headquarters took place June 18th at Valley Forge, Pa.

A company has opened an office in New York for the purpose of mining in Arizona, dealing in land, etc., with $10,000,000 capital.

Every new subscriber who does not receive tbe paper, and every old subscriber not credited on the label, within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect ourselves and subscribers against the acts and mistakes of others.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

How to Stop this Paper.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Settlers and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 16,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

Sample Copies.—Occasionally we send copies of this paper to persons who we believe would be beuefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

Extra Copies can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Printer's Proof Press, complete and in good working order, for sale at this office, at the low price of $30. Call and see it.

Experimental Machinery, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. Fuller, 415 Market St., second floor, S. F.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Numa Mining Company.—Principal Place of business, San Francisco, California. Location of works, Humboldt County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of June, 1879, an assessment (No. 1) of Three Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 328 Montgomery St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of July, 1879, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 11th day of August, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.
Office, 328 Montgomery St., Room 21, San Francisco, Cal.

Books for Miners and Millmen.

Kustel's Roasting of Gold and Silver Ores, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

Kustel's Concentration of Ores (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

Phillips' Explorers, Miners and Metallurgists Companion, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 672 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10 50 Sold by Dewey & Co., S. F.

Aaron's Testino and Working Silver Ores.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

Copp's Handbook of Mining Laws.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

This paper is printed with Ink furnished by Chas. Eneu Johneon & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y.

A. S. HALLIDIE,

Office, No. 6 California Street,

SAN FRANCISCO.

Manufacturer and dealer in all kinds of

Iron and Steel Wire Rope,

Flat and Round, for Mining, Shipping, Hoisting and General Purposes.

Having the most complete and extensive Wire Rope Works in the United States, I am prepared to manufacture Wire Rope and Cables of any length or size at short notice, and guarantee the quality and workmanship equal to any made at home or abroad.

Iron, Steel and Galvanized Wire

Of all sizes on hand or made to order.

Barbed Fence Wire.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Cepe, Fuee of all Grades, Vulcan Powder Thawing Boxes, Batteries and Explodere, For Sale at the Lowest Ratee.

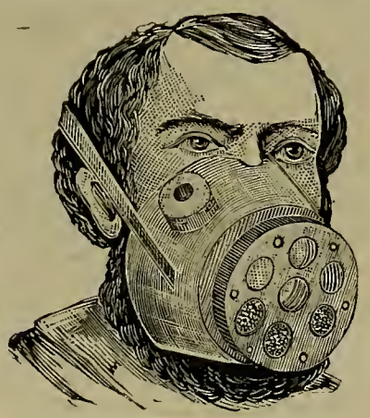
VULCAN POWDER COMPANY,

Office, 123 California Street, Rooms 25 and 26, - - SAN FRANCISCO, CAL.

— PATENT —

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.

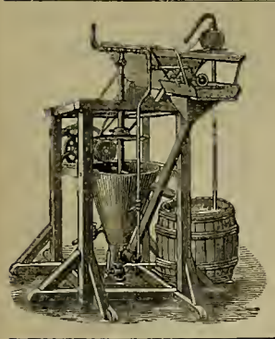


INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price

SETH MARSHALL, Jr., Agent,

309 California Street, San Francisco, Cal.

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



THE ELKINS "BOSS" GOLD AMALGAMATOR,

Is the Best, Simplest and Cheapest Amalgamator in Use.

Nothing about it to get out of order or wear out. Weighs only 500 lbs—heaviest piece weighs 100 lbs. Is automatic in its working. Measures, feeds, screens and passes all material through a large body of quicksilver; then washes and cleans without care or attention. Requires no more power than a large grindstone. Uses water over and over again where water is scarce. All water required can pass through a ¾-inch pipe. Capacity, two to four tons per hour. Saves 90% of precious metals. Price, $250. Pump $25 extra. Send for circular.

ELKINS & LYNCH,

No. 381 Pine Street, - - SAN FRANCISCO.

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE.

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

CAUTION!

To Section Chimney Builders.

All chimneys on which joint hands with cement, or its equivalent, are used to make the joint smoke and fire-proof, with rods, clamps, or their substitutes, to brace the chimneys to the buildings, are INFRINGEMENTS on my patents. My patents for sectional chimneys have been sustained in every instance.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERT. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

Western Iron Works,

316 and 318 Mission Street, San Francisco,

PERRY EDWARDS, Prop'r.

Manufacturer of Wrought Iron Girders, Trusses, Prison Cells, Iron Roofs, Crest Railings, Finials, Fences, Weathervanes, Gratings, Iron Work for Models, Etc.

Nickel Plated Railings. Bank and Store Fittings. Estimates given and Iron Work furnished for Buildings.

Dewey & Co. { 202 Sansome St } **Patent Ag'ts.** | *Engraving done at this office.*

THE RISDON IRON AND Locomotive Works

Corner Beale and Howard Sts.,

SAN FRANCISCO, CAL.

W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't.

Builders of Steam Machinery

IN ALL ITS BRANCHES,

Steamboat, Steamship, Land

Engines and Boilers,

HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.

ORDINARY ENGINES compounded when advisable.

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.

STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.

SHIP WORK. Ship and Steam Capstains, Steam Winches, Air and Circulating Pumps, made after the most approved plans.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

CAST AND FORGED

STEEL SHOES and DIES,

CAMS AND TAPPETS,

Blake and other Ore Crushing Plates, Etc, for Quartz Mills. Also

Steel Cranks and Castings

Of every description. For Circulars and prices apply to

J. L. HULL,

401 Market Street, San Francisco.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER,

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Main Street Iron Works,

WM. DEACON, PROPRIETOR.

Nos. 131, 133 & 135 Main St., San Francisco.

Stationary and Marine Engines,

Shafting, Pulleys, and General Machine Work. Jobbing and repairing done Promptly and at Lowest Rates. Screw Propellors, Propellor and Steamboat Engines.

SAW MILLS and SAW MILL MACHINERY.

BROWN'S Ledger Papers.

Acknowledged to be the best Papers for Blank Books. Will resist the SEVEREST TEST of erasure and rewriting. Received the HIGHEST AWARD over ALL OTHERS from the UNITED STATES CENTENNIAL COMMISSION. Have your Blank Books made from them, and no other.

H. S. CROCKER & CO., SOLE AGENTS.

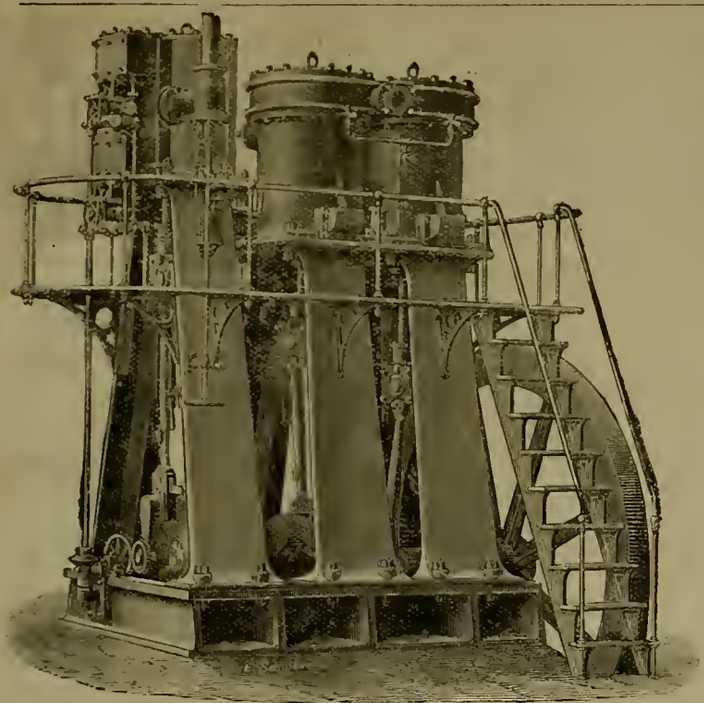
GOLD MINE WANTED.

One now paying more than expenses. Addres

W. S. KEYES, M. E.,

No. 310 Pine St., Room 42, San Francisco

Patents OBTAINED IN U. S. AND FOREIGN COUNTRIES; trademarks, labels and copyrights registered through DEWEY & CO.'S MINING AND SCIENTIFIC PRESS Patent Agency, San Francisco. Send for free circular



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

No. 417 Market Street, San Francisco.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

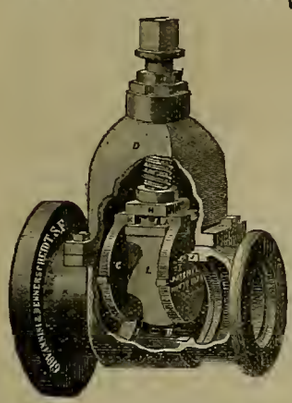
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

GIOVANNINI & CO., 417 & 419 Mission St., S. F.

Liberal Discount to the Trade. ☞ Send for Circular

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

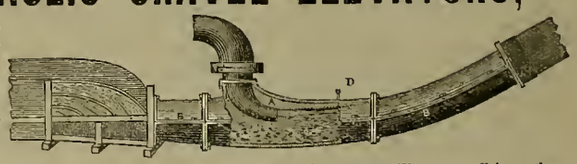
Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

SAN FRANCISCO GOLD, SILVER, NICKEL AND COPPER PLATING WORKS,

Nos. 653 and 655 Mission Street, San Francisco, Cal.

EDWARD G. DENNISTON, - - - - - - - - - PROPRIETOR.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY,

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.
